Middle East Journal April 1947  
"16n Saudi's program for Arabia" Richard H. Sanger

P. 186 "Irrigation in the central part of the country presents a different problem.  
Here the rainfall in the Tuwayq Mountains on the west sinks beneath  
the ground to the limestone table underlying much of that part of  
Saudi Arabia, and flows eastward under the Nafud and Al Hasa  
to come out in the Persian Gulf. The fishermen of the Bahrain Is.  
still obtain some of their water by diving overboard and filling their jetties  
in the fresh water springs that bubble up in the Persian Gulf. The  
great oasis of Hofuf is kept fertile by forty artesian wells  
whose water seeps up through breaks in the Al Hasa limestone  
in sufficient quantity to irrigate more than 2 million date trees.  
Riyad, Dihlam, Bishayyah and Unayzah --- draw their water from  
these underground rivers." & "most striking of all are the great  
water pits in and around Al Kharj, 50 m. S.E. of Riyad. These  
are often one hundred yards across, they look like quarries but are  
really lakes formed by the collapse of the surface limestone table. They are filled  
to approx 100 ft. below surface of ground with fresh clean water that has made  
possible the ag. experiment at Al Kharj."

JEDDAH JULY 28 1948

DEAR MR. ERDMAN:

THE NAME OF THE FISH OF WHICH YOU DREW SUCH A GOOD PICTURE  
IS *سلوق* OR IN ENGLISH CHARACTERS TRANSCRIBED "SAMLOG".

ANY TIME I CAN BE OF HELP TO YOU IN MATTERS OF THIS SORT  
I SHALL GLADLY OBLIGE.

SALAAMS

*Kussain  
Tahir*  
*[Signature]*

Jeddah July 24 1948

Dear Mr. Don:

Thank you very much for sending me the nice letter. I hope that you are feeling much better now and that your sickspell is something in the past. I was really glad to be able to help you and so was Ali. We got a lot of fun our of it. Thanks once more for the little things you let me have. They may come in handy when I go fishing myself. Ali has quit and he will be going back to Yamen. I will take your advise and go to see Dr. Gonet but I am really feeling very much better myself.

When the pictures you took are developed, please send me a print of the one you took of me. And if it is not too much trouble will you please send me a little of that fish poison. I have seen some more different kinds of fish which you dont have yet. Also some large jack fish you were after. And when you are back in America, please see what you can do for me. It sounds good the way you talked about it. It would be a real opportunity for me to be able to visit the United States.

I hope that you will come back to Jeddah. If so, I will be glad to help you again.

Salaams from your

*Assistant Hussein*

*W.M. Cullen*

Dear Hussein

July 20, 1948

I hope you will be able to find out  
the name of this snapper for me. You  
may remember you ate some of them which  
we caught at Balat Ashra.

1900  
beginning

Thank you, very much  
for your cooperation

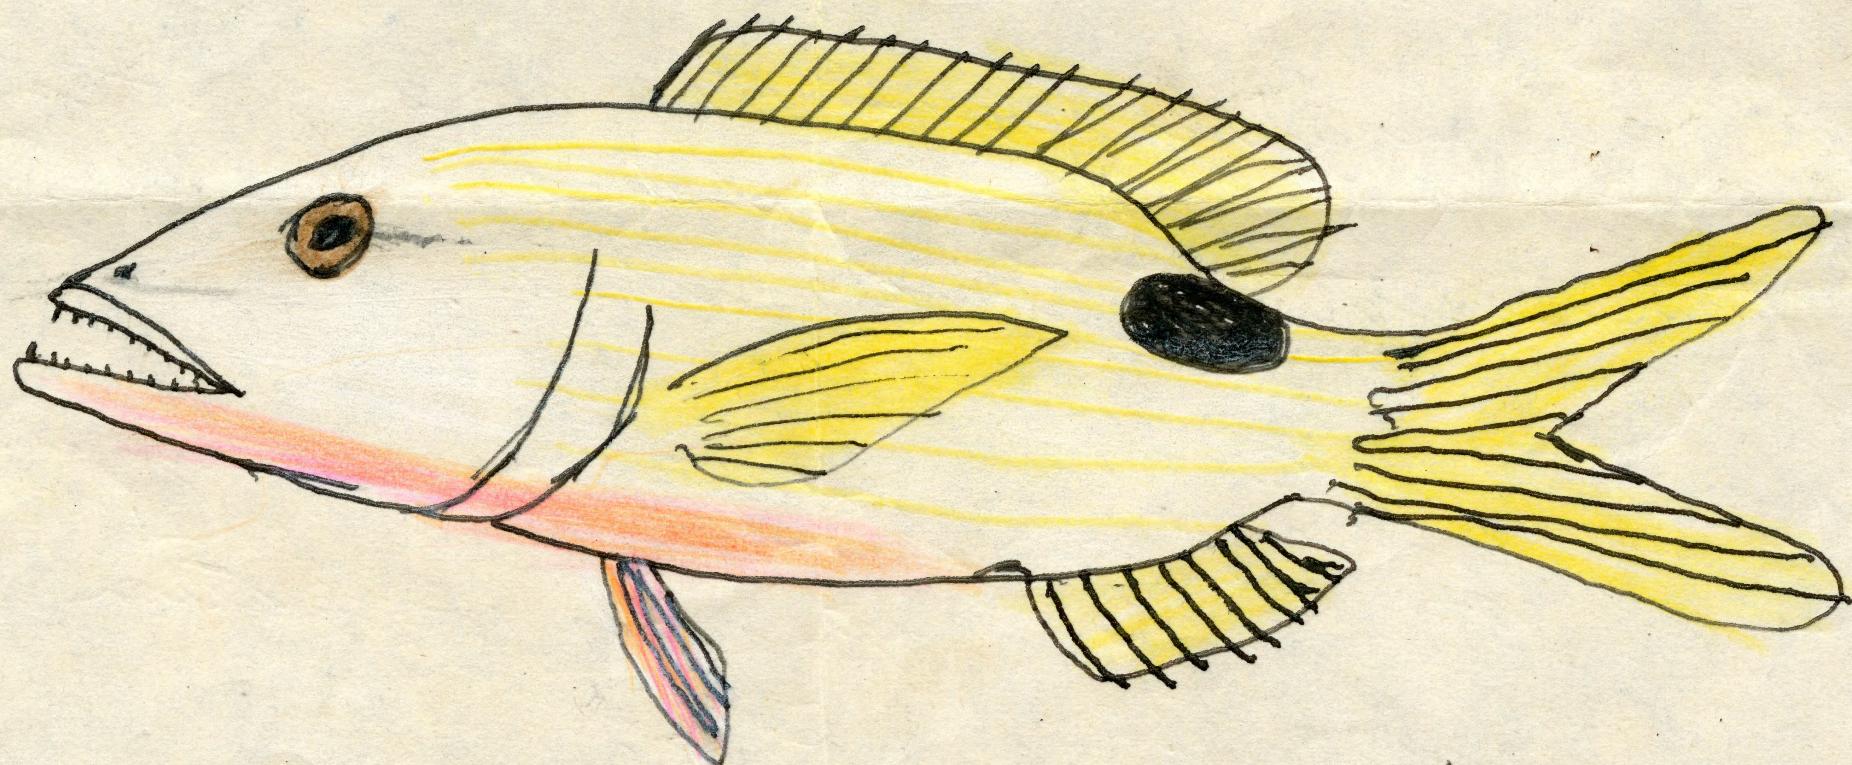

You can give Mr. Campbell  
the name to send on to me at Ras Tanura Sincerely,  
Tom Erdman

Lane, W.H. "The game fishes of the Persian Gulf"  
 Journ. Bombay Nat. Hist. vol. XXV p. 121-135 1915-18  
 not of much scientific interest except

p. 133 Tir-mukha - *Chanos salmoninus* "at certain seasons of the year the waters of the Persian Gulf are covered by extensive patches of thick red scum, about the origin of which there are several stories. In this scum, shoals of large tir-mukhas, up to 15 or 20 lbs in weight, are frequently observed. --- They swim about with their backs above water and mouths wide open."

Log Mar. 22nd 1948

I left La Guardia airport on the ARAMCO "Flying Camel" about 12 noon today. Mother, Dad, Roz, and Nat saw me off. The weather was clear and spring like with moderate wind.

Our first stop was Gander, New Foundland, which we reached about 7 P.M. New Foundland was still covered with considerable snow, and there were great many evergreen forests. Part of Gander Lake was frozen the other part open water. The temperature was probably in the thirties.

We saw a most beautiful deep red sunset, something like the Arctic sunsets you read about.

After a meal of or including salt cod, we went on to Portugal. I wrote a letter to Lynde and I to the folks.

It was a moonlight night and the clouds below us gave the appearance of great snow fields and icebergs on the ocean. It was not until later that I realized my error. We flew around 8<sup>000</sup> to 10,000 ft. up above sea level.

Mar. 23rd.

Portugal

We had a good clear sunrise today, and arrived at Lisbon (Lisboa) at 12 noon. Portugal was fair a beautiful from the plane with neat terraced fields, and bright green grass, and white washed houses with red tiled roofs.

After going thru customs, we piled on a bus about 30 of us, men, women, and babies, and drove thru Lisbon and 22 kilometres south to Estoril, on the coast. We stayed over night at the Monte Estoril Hotel which was very commodious with tall doors and high ceilings.

After lunch, Walter Sprague, my seat partner, and I walked around town a bit and down to the beach. Nearly every body has lovely gardens with vegetables and all sorts of flowers.

Palm trees, Pines (like red pines), and a kind of Eucalyptus? (long thin oval leaves with bark something like sycamore) were present along.

It was really hot with the bright sun, and some people were swimming in the ocean. The ocean water was congruable in color to Long Island and had sand with black rocks interspersed.

I found black periwinkles (small), key hole limpets, and rock crabs (one about 1 inch long was flat and square with long legs like stone reef crabs in the west indies). Green Elodea and a brown kind of bladdernack were seen. The difference between low and high tide was considerable possibly eight feet. It was high about 3 p.m.

Portugal

"

In a park near the hotel, there was a cage full of love-birds, of varying colors some light blue, some pink, yellow, or green.

Pigeons and English sparrows were abundant. I saw one yellow finch, and a number of dark swallows.

After a rest, Mr. Kidd joined us for a walk around to see the sunset, and a near full moon overhead. We went to the top of a hill thru a narrow street with many shoe shops on the way. We looked at the sea and the sky and a small woods from the hill top, and smelled the cool evening air. We heard a number of pretty bird songs.

For lunch we had real sole, "linguado," a fish about 14 inches long apparently boiled whole tho I did not see the head. It was thinner on the sides than a flounder the same length. I was not impressed with its preparation and it was without much flavor. It was probably a true Soles.

For supper we had "salmonete"; large goatfish 12-14 inches with chin barbels, Upeneus or more likely Mullus, it was boiled whole but had excellent flavor including the meat in the head. It tasted something like Porto Rican Upeneus but was better, and did not have that characteristic unpleasant smell.

This evening, I wrote letters to the folks a wife and cards to the Woods, Tony Tenera,

lorry, mule, & one other.

Mar 24. Wed. We got on the bus about 8:30 this morning and drove to the airport. It was more interesting because of the open markets, and peasant women walking with baskets on their heads. Many were barefoot, and a number fish peddlers. A number of tables had 3 ft. long macrourid silver fish with long jaw like Trachinus but a small macrourid like tail ~~— 10 cm —~~ I didn't get a close look at them. Others had snappers probably Tutjanus.

The trolleys in town are yellow and small like tunceville trolleys. The newer streets are broad, the old ones narrow and strictly one way. The cars honk their horns a lot, and there a policeman but no lights. The people are good looking as a whole and appear adequately fed. I liked Portugal a lot, my one criticism is that all the land is occupied and there appear to be no wild spots except possibly in the mountains in the background. The country is probably overpopulated.

We left about 10:30 A.M. Our flight over Spain was interesting; it is far more rugged hilly and mountainous than Portugal and it is far less green and appears dry and rather unproductive. Some of the mountains in southern Spain as we approached the Mediterranean, were snow capped. They were

probably 6,000 or so feet high.

The Mediterranean was blue as they say in books and had white caps from a stiff breeze in the eastern end. Our first view of Africa were the rugged Atlas mountains which come right to the coast. They are very barren looking.

We passed over northern Tunis about 3 p.m. and saw the coast of Sicily in the distance. We flew over Malta about 5 o'clock. It is a flat roundish island with two good harbors. It is cultivated and terraced to the hill with a number of large towns, and a catholic church in the center surrounded by a park of the island only trees. The island appeared definitely overpopulated.

We saw other small rocky barren islands off the coast of Africa which were uninhabited.

We crossed over Alexandria shortly after dark. It was well lighted up and is on a long narrow peninsula. We reached the Cairo airport about 12 midnight.

The airport smelled like a camel stable, though I saw no camels. The characters were varied in dress and appearance some in uniforms had fezes, and others the cloth turbans.

We ate at the airport and continued about 1 A.M. flying over the desert and the Suez canal in bright moonlight.

The Egyptian desert was hilly and gutted with

Mar. 25

deep valleys at first varying from reddish to almost pure white sand. Dawn finally came and there was a dusty orange sun rise with a dust haze over the desert. The desert was sandy with small hills and no apparent vegetation. We saw a couple of Bedouin camps with lights or flares. As we approached the Dharan airport there were a few widely scattered palm trees, and the weeds on the desert.

We reached Dharan about 8 A.M. and spent about 2 hours in customs while the officials satisfied their curiosity by looking them over baggage.

I live at house 4165 in Dharan in a room with Ed Gurley. I got settled with a shower and tried a little native with the house boy, and fell on the bed. Ed finally arrived and he appeared in good spirits, but has had his troubles with numerous red tape.

I met some friends of Ed's and Mr. Kerr who is interested in our project and in a position to help us. He asked me what my Ph.D. thesis was or whether it was studying for one or not hardly before I could get out any answers.

The air has a distinct dust taste to it, which I continue to notice. Yesterday they had a real shamal blowing here.

Mar 26 - I got up for breakfast early today. Ed had planned a car trip to Khobar on the west the nearest town about 5 miles away.

We went down to the river in a coupe, and looked over the dhows which were at the dock. They paint them with rags dipped in pitch oil, and it seems to do a good job. The dhows have good lines but are very much greased together.

Fish around the river were small but abundant in numbers and there were several kinds. The water was bluish and fairly transparent. I saw fish that looked like serring, one mackerel and a gonoracanthid? and several batches of young fish. The bottom is mud and deepens very slowly. It is coolish still at night getting hot during the day.

Ed felt sick so we cans back early. We drove than the town, and saw the bazaars open with their bright colored caps and rugs. Flies were everywhere even all over the small children, and we saw some dried fish.

The people have large good looking shaggy black goats with long pointed ears. They have some sad looking thin brown cattle, and camels which look like warros. I haven't seen any camels yet.

The women all wear black veils over their faces up to the level of their eyes.

Friday is the arab Sunday, so it is a day off today and all things are closed down.

This afternoon, Ed and I drove to Ras Tanura which was a most interesting drive. We drove over salt flats, by date palm orchards, and wells, and artesian springs. In one shallow

sand by the side of the road I noticed numerous Cyprinodon dipper with bands on their tails and some nearly 2" in length. There was some grass in the water and a brownish kind of alga. Over the other side of the road was a small stream going toward a date palm oasis. There were some more small minnows, and a small larval ~~beetle~~<sup>mite</sup> which ran or swam along and would burrow in the sand. It had no containers and no preservative, since all of such is still at the customs. The sand beetle was the color of the sand, save for black eyes.

On the Ras Tanura pier in about 10 feet of water there was considerable current with numerous 8 to 12 inch half-beaks. Arabs were catching them with very small hooks on light lines which they baited with half-beaks. By jerking the line occasionally the motion would make the fish strike. Sils? is the local name. <sup>also there were</sup> Small bumpers.

Mar. 27 - Today I went thru what is known as "processing". We were given forms to fill out, and it included one of how we wanted to be buried etc. Ray Carlson gave us an idea of the history of the place which was interesting. I also met Dr. Dugay, the entomologist, after my physical exam. He told of an oasis to the south where there might be good collecting; so it is possible that it may get down, but rather doubtful. Little progress was made for our field work.

Mar. 28 - Another day of rounds with Ed Gurley meeting various of the big wigs, I was called

down to customs, but he was there (I mean the right "he"). We stopped at the camp fish house which is just a three sided cement hut on the edge of the desert, and Arabs and coolies were hacking fish into fillets. All the fish were over 5 lbs and there must have been close to a ton of fish. There were 5 species in all: a grayish black grouper (subat), a grouper red spot (hamur), Lethrinus with yellow stripes or lines (shiazi), a large bluish pink porgy with a lump on top of the head before the dorsal spines, <sup>(Thop)</sup>; and a pink large porgy without a lump (begere). The spotted grouper; some had large gonads with near ripe roe. The place was hardly  two want might be called sanitary, and fish was wasted.

Note - Mar 27 - This evening, Gurley and I went down to the pier at Al Khobar to see what fish there were. An Arab gave us our first fish a Pomadasys impaled on a pronged spear. The water was oily, so we only got one pipefish, and several young snappers, a dead mullet, etc. The collection is U-48-1.

Mar. 29 - Another day of disappointment but with some distant rays of hope. Gurley took me to see Olliger and Davies, two of the top men, and we had a pleasant conversation, but that as far as it went. Another trip to Al Khobar proved nothing had been done on the boat; so Gurley got action by calling Davies. I filled out 2 forms for expense account. The afternoon, I spent over in

the relation division library and with the help of Miss Petersen ran across several interesting books.

Villiers, Alan "Sons of Sinbad" Scribner, 1940  
an interesting account of sailing in Arab dhows  
and an interesting chapter on the dreadful life  
of pearl divers in the Persian Gulf.

Twitchell, K.S. - "Saudi Arabia" 1947 Princeton Univ. Press  
chapter on Bahrain with numerous photographs.  
Brothers, G.W. Persian Gulf (Handbook) 1920

April.

Rihani - "Around the coast of Arabia" Houghton  
Mifflin, 1930, Boston p. 280 "dawl" a kind  
of apparent jellyfish with 2 foot tentacles  
hunted by pearl divers.

Mar. 30 - I accumulated some jars today from  
Joe Martin at the dining hall, and alcohol and  
formalin from Bill Monger at the clinic lab.

No dice on my stuff at customs, and the day  
was generally frustrating. Tonight we heard  
an Italian orchestra, and a meeting of the  
entertainment committee wanting information  
on how to spend its \$30,000. I finished  
a letter to Suicide, and it was not a very happy  
one.

Mar. 31 - I straightened out the ship's larder  
with the commissary, today Mr. Shea, and got  
one jar from the Club.

This afternoon, I drove in a pick up to  
Bas Tanura, and stopped by the side of the

same pond on the right side of the road near Safwah  
and collected some pond weed, Cyperodon digressus,  
2 frogs, and a polyphemus. The bottom was muddy and  
all the shells were up at the windward end in the  
lee of the sand. I found no burrowing tan beetles  
on the other side; they had disappeared. I also  
collected a number of snail. I saw a dragon fly  
larva, and a bright blue dragonfly, and got a dead  
beetle. This collection V-48-2.

On the Gulf side about half way out to Bas  
Tanura there were 2 similar salt water sand  
pools about 40 feet long and 10 feet wide and  
may be 4 feet at the deepest, one was larger  
than the other. I got 2 species of Istiganoidea  
young fishes, by attracting them into the net. This  
makes collection V-48-3. The fish were just the  
color of the sand except for their black eyes.

April 1 - I got my things out of hook from the  
customs today. They were at the storeroom. I also got a  
load of a few more small jars. This afternoon  
was used up in getting all drums and barrels  
to be fixed for fishes. This evening the wind  
came up and it seemed cold out. I watched  
the dance in the patio, and actually went back  
for my overcoat.

April 2 - Surley intended to go to Bahrain  
today but a strong shamal took care of that.  
I had somewhat of a cold and spent the day  
reading the "Lions of Sinbad"; according the author Arabs  
use coral rock, lime, and mud to make their houses.

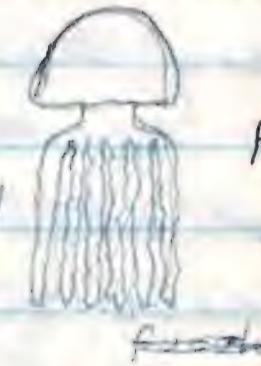

Apr. 3 - We were to go to Bahrain at 9:00 A.M.; we finally left at 1:30 P.M. Two launchers broke down and we got picked up by a motorized dhow with Arabs, and reached Manama, Bahrain, about 6:00 P.M.

There were over 50 sailing dhows in the harbor, as we entered (an impressive sight). On the way over I counted over 300 well shaped grey opaque jellyfish with bells up to 8" in diameter. The tentacles were studded about a foot long and often a bright blue purple. They were fairly well spread out over the open gulf water.

This evening, Ed and I drove around Bahrain and out of town to a date garden with a fresh pool where boys were swimming and could dive for "baliseesh". We also talked to Mr. Karas who owned our dhow, and he consented to our hitting holes in the deck. This evening after getting set up in the coffee house we drove to Owalli to see the Bates set up, and we met some interesting English fellows: Jerry Smith, an artist, Morris Hayes, a Sultan, and Bing Ford, an undertaker (a friend of Bill Lubman who went with us). Mr. Chat had no telephone so I did not call him.

The water of the Persian Gulf is quite a clear blue with varied sand and coral and some seaweed bottom. There was considerable sargassum like weed floating in spots.

Apr. 4th - I woke up with a worse cold this morning, but did manage to stagger around a bit to see the town in the morning. I went to a local market and saw dried fish including

fogolat or  
jeddah

feet

1 foot mullets, small siganids, small gerrids, small carangids like Oligoplites, and sardine like herrings.

I walked along the wharf and watched men working on their dhows, and donkeys and carts bringing in coral sand way out on the flats. There is quite a bit of sea weed brown in color, and also what looks like true Udoa (bright green in color). The tide differential appears to be great because the bottom deepens very gradually.

This afternoon we left Manama about 2:30 P.M. in a launch and we reached Al Khobar about 5:30 P.M. In spot there were large rafts of sargassum like weed.

Apr. 5th - I chased around all day today getting equipment together for the boat like fish panels, etc. I felt completely miserable with a cold.

Apr. 6th - Still utterly miserable, but I got all the food for us and the Arabs today, and cleared thru customs.

Apr. 7th - Miserable with the cold still, a stencil of sand outside, I checked on a few items, and spent most of the day on my bed.

Apr. 8 - Miserable, I managed to get some more equipment for the boat, and with the help of Mr. Bruchard I got a couple of crab net made with 2 hole handles and stiff wire for hoops. I made up one net with some of Burley's fish line.

Apr. 9 - I made up another crab net today

27 letters to smile & folks

and coughed my head off. This I saw a flock of interesting birds (robin sized) with yellow-orange throat, long oriole bills, needle points tails, and a call like the wind whistle thru a reed. There were about 50 of them near the club house.

I also collected some moths and tiny flying ants from the window in our "boracay."

April 10<sup>th</sup> - I took anchors and some of my stuff down to the boat, and got the crew to help me make an eel pot. We also loaded on our row-boat with its two bottom observation windows. I saw two sailing dhows with long white thin twine nets with leads and bobs like gill nets only with rather smaller mesh.

<u>Aspis cerastes</u>	Stoned viper
<u>Echis coloratus</u>	saw scaled viper

Apr. 11 - We didn't go today still more delays and running around picking up odds and ends.

Apr. 12 - We couldn't go today because the liaison office hasn't got our clearance, and our water tanks also needed fixing.

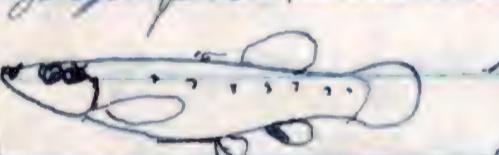

This afternoon, I went 2 km. south of Al Khobar and made a small collection at ebb tide from near shore on mud sand with pieces of weird shaped coral rock (many were overgrown with barnacles) and these rocks were dark brown in color and had one to five or six crabs underneath all of them. I saw one light brown thick small eel 3-4". Other fish were small sorgies which took refuge under the rocks (11 were collected) and 1 pipefish which drifted into the net, and numerous killyfish up to 2" which resembled F. majalis in sand color and markings, but were considerably more elongate, than the fresh water Cyprinodon disper.

Apr. 13 - No good news today. We had a shamal & some rain last night. This morning after checking on work on our water tanks, which were to be steamed, I went down to the boat and made up a second eel pot.

This afternoon, I saw a flock of curlews with curved bills just south of Al Khobar on the

These, however,  
were C.  
disper as  
later discovered

V-48-5

flats. I went about a km. below where I was yesterday. It was all flat mud sand flats with stranded very shallow ponds. As I walked barefoot in these ponds fish or shrimps (the exact color of the sand) would dart back and forth. I caught a number of small gobies  with superior eyes like *Dactylopusus* and a long united ventral disc. The mouth was definitely superior. I also got a number of young *Platycephalus* ( $\frac{1}{2}$ -1" t.l.). Sand colored shrimp, ghost crabs, hermit crabs, snails were abundant, also I saw a couple of anemones, and collected one.

Note: from time to time as a couple of days ago I have seen channel *Scomberomorus* <sup>commersonni</sup> with brown bands like the Australian species and rather elongate like the Kingfish brought to the dock by trolling parties.

Apr. 14, 1948 - This morning, I rescued the cook's belongings from our boat, since our quarters did not appeal to him. I also handled my laundry.

This afternoon, I took a trip along the shore as far as Saibat, and noticed many fish traps of date palm fronds along the way. Just south of Damam, I collected a *Terapon* in a drainage ditch from a date garden. The water tasted fresh and was about  $\frac{1}{4}$  mile from the Gulf or less. Cypinodonts were also present. The terapons varied from  $1\frac{1}{2}$  - 4 inches and were rapidly swimming back and forth. I caught one with the help of an Arab who was passing by.

I saw one more curlew, a turnstone, several

plovers (just like semi-palmented places), and sandpipers like the semi-palmented with longish bills and non-desert plumage. Just near Al Khobar I saw a grey and white hawk like a goshawk.

I met an Arab contractor Abdul Latif Almusa, a contractor, who was in a truck that failed to go into high gear. He was bound for Qatif, and I gave him a ride there and sat in a tent on the desert while he wrote out some letters for his time keeper. He lives temporarily in Al Khobar but his home is in Basra. Arabs on the whole takes things as they come, "In sha Allah"; rather than rush around as Americans do; the contrast was rather a relaxation for me.

The *Terapons* had bronze yellow coloring on top and white silver below with the black stripes, a striking color combination. Collection V-48-6

Apr. 15 - Today I talked with Mary Leonardini, the school teacher, and she wanted me to lecture sometime to the gang, and also the children. This afternoon, I took Philip Brown, a sixteen year old, with me and we collected in the same spot as yesterday for Terapon, and two new places for *Cyprinodon dispar* at a brackish overflow well near the shore south of Hanover and another flat marsh about 1 km. further south. I also got young mullet in the well overflow (a pipe pouring out water from the ground). Philip is a nice fellow and a good help. This evening, I went down to the Khobar pier and with the help of Chuck Head got a few fish (red, pipist, halfbeak, & *Pomacanthus*).

Red letter day - To Ras Tanura

27

Apr. 16 - We at last got started today with breakfast at 5:15 A.M., and leaving the dock at Al Khobar about 6:30. We reached Ras Tanura about 12 noon, and bucked moderate north winds all the way. There was a rather cloudy sky most of the trip and it was cool. One of our guests got seasick. We saw several porpoises, cormorants, gull, terns, and birds like petrels black and white with small bills (but more the size of shearwaters). We trolled 2 lines most of the way with spoons or jigs and got a couple of strikes according to Garley. He had different size leads also and about 100 feet of line trolling. We stayed at the west pier at Ras Tanura. There were a great number of fishes to be seen blennies  grey with orange and black stripes, black pseudochromids, Ablabys marginalis, black pomacentrids, greenish wrasse in and around the wharf dock stones also a pomacentrid with yellow spots on dark. On the bottom were goatfish, gobies, and parapercids? Lubatis, spotted Hamur, scads 2 kinds, mullets, black tip & white tip, barracuda (1"-15"), and a large puffer, all in fairly shallow water. Atherinids were also present. A man came in with a banded Scomberomorus from trolling.

The beach is used as an outdoor toilet so collecting along shore is unpleasant. The bottom is mostly sand with scattered short grass beds anemones 1 foot in diameter; some small brain coral, and brown sponge like finger coral . There is some soft coral or sand rock along the shore with lots of crabs under the rocks. Eel not coll. V-48-9

Apr. 17 - One of the crew speared a couple of cuttlefish they are brownish with a light blue border around their edge, they are not nearly as active as a squid, and their bones will float as soon as they are removed. Actual observation of living specimens at night proved that they were quite rapid in movement when they chose to. This morning was very hot and sunny, and in a very short time I got a burn which I felt the next day. The crew caught 3 Hamur (1 possibly 4 lbs) Epinephelus taurinus? We ate one for supper. I took a photo of one. Native carpenters finally came aboard today and the way one stood on top of the plywood over the open hatch working furiously at the big saw with both hands and close to his bare feet was a sight for a circus.

This evening, I walked over to the west pier and watched large schools of scads feeding at the surface, and also a large flock of small gulls with longish bills swimming on top pecking at the same water from time to time. I also saw a <sup>Pteroplatea?</sup> Ray on the sand; one with wide wing spread & no tail. Around the dock rocks on the lee side I also saw Ablabys marginalis. Natives were fishing for half-beaks but were not catching many. They were using small hooks & lines.

We tried a 100 watt bulb light over the side tonight and even in competition with wharf lights; it attracted a great number of larval fish & small bright blue dascyllidids (I caught two of them) and one sea snake. Another larger sea snake, a fellow speared for us. The one I netted was going dead on; he started to swim backwards but it was too late. They are more sluggish on land than in the water. They both had wide  black bands on a sand colored background and had the typical rounded & flattened tail. The small snake was in the process of shedding his old skin, which may have made it easier to catch him in the net.

Apr. 18 - Partly cloudy and cool in morning with light shamal, clear-

ing at noon with strong winds. Yusif pointed me out a "dawd" dawd or whatever an opaque jellyfish with a dark brown lower border & long tentacles. This is supposed to be the brown bad biting variety. Off the front of the dock, I think

I saw a school of siganids under a barge. I am still catching stuff with my eel pot. We went over to the south side of the dock today because the wind was north. There was a lot oil on the water so night fishing with the light was non productive. More carpentry went on on the boat.

Apr. 19 - It was calm this morning and we moved back to the north side of the dock. I took a row to the north along the shore and picked up 3 black sea cucumbers about 10" long. I cut them open but there was no *Terasperos* inside. There are holes in the sand with banded gobies I think, one at each entrance.

I guess poison is the only way that I could catch them. Some finger coral heads are about 3 or 4 feet in diameter, and others smaller, a brain coral a foot in diameter is large for here. All the live coral is 5 to 10 ft. below the surface at ~~high~~ tide. This evening, we went offshore and tied up to a barge in 5 fathoms of water, about 250 yds offshore and 4 to 500 yds from the dock. We fished with the light (100 watts over the side). I used the crab net with bobbineting in place and a lift up hoop net when the tide was slack. We saw several sea snakes like the others, and one small pink squid. Some small blue atrinids were at the surface with larger ones below (greyish in color) Herring shot up from below from time to time and got caught when they dove into the hoop net. Otherwise I never knew they were there. I saw several edible sized blue crabs with mottled brown on white all 4s with grey eggs, we caught one. Also we saw several white things swimming backwards by kids.

SD

We thought they were cuttlefish but I finally landed one and it went bang bang on the roof deck. It turned out to be a mole lobster, V-48-11 with eggs. A couple of bill fish came in sight and I almost got one. I saw one edible sized sponge, and several smaller ones with long red antennae.

Apr. 20<sup>th</sup> - Another wasted day in port, but the radio finally got fixed. The wind was strong from the south all day with a lull at sunset but increasing after dark with such a roll that we had to come into dock and sleep with the flies. Night light fishing was impossible because of the roll of the boat and oil on the water. I got a few fish in the eel pot, but that was all for the day. I also finished a letter to Incile.

Apr. 21 - Calm at dawn with increasing south easterly winds. We ploughed around most of the morning. Darley had to go to the bank, Stewart to the clinic. And the crew had forgotten to get water aboard for themselves. The flies are thicker than ever. I set my eel pots away from the dock about 100 yards, and was rewarded with a much larger catch of small fishes in a short time than at the dock. Surprisingly we got started on our survey at 12:25 and headed for Saibat. There was a fair breeze from the south east, but we had a good trip. We caught two chanad, about 17-18 inches; one had a small herring in it. ~~18.3 18.1 18.0 17.9 17.8~~ They had only 6-7 gill rakers, and not many teeth. We ate the two which were not saved for specimens. Darley saw several flying fish. There is considerable shoal water between Rao Tanura and Saibat, but the water was not clear enough to determine the types of growth on the bottom. We anchored a mile east of shore in one fathom of water with that fine silt sand bottom which acts like mud but is not. I nearly lost the eel pot by fishing them here. I caught four *Terapon* I kept as specimens,

and 3 mottled blue crabs. There were a number of old jilboats stranded on the beach which would make a good picture. We finally obtained permission to go into the town, and we looked at some throw nets and the different fishes in the market place which consisted of porgies, band head porgies, jolt heads, terapions, lethrinids, <sup>Dorosomidae</sup> chanas, sardines, one 2 foot scarus (like Bleekrads), scads,  $\frac{1}{2}$  beaks, parapercids, seriola, remipterus, sillago, leather jackets, Plectrohynchos or Kyphosus small, gurids. They were all partly dried and one sabati (*Sparus curvirostris* had dried fins) and were stinking and covered with flies. There was a big rain storm tonight, and one early the next morning, and we had quite a row against a head wind to get out to the boat.

Apr. 22 - Our light plant shorted last night after the electric storm and ran, so we are headed back to Ras Tanura. At 8:35 A.M. we caught a chenard on a jig. I saw a small flying fish with darkish wing white tips and greenish back like the shallow Gulf water. About as soon as we hit the dock the flies came aboard in droves at Ras Tanura. The chenard had only four gill rakers on each arch. It was 795 mm. s.l. and had mature milt and testes which could be pressed to exude milt. There were also only a few teeth, and it had a large shrimp in its stomach. Abdullah and I set a big wire fish pot by a buoy baited with mackerel heads. I also set my eel pots several times and by finger coral heads and caught much the same stuff as yesterday.

The cloudy and calm in the morning it continued calm but sunny in the afternoon, when we caught a small mackerel, U-48-15, on our way back to Saihat, after we had the wiring redone. I also had 2 small barrels prepared with formalin & water. Our big trap only yielded 3 fish, 2 scolopsis and 1 lethrinid; it was set at a large buoy at Ras Tanura. This evening it rained and was very windy

at our anchorage at Saihat. I managed to catch 3 small halfbeaks with the hundred watt lamp U-48-16. During the night the tide went out and we rested half in water & half in mud with hard changing winds.

Apr. 23 - Cloudy and calm in the morning, with increasing East by south strong winds and white caps. This morning, I snotted drifting gulf weed into the boat at Saihat and got one two inch scorpionid, U-48-17, and several crustacea mostly shrimp and small elongate oysters.

After breakfast, we headed up Tarut Bay to El Qatif. The captain and two hands went ashore with the customs officer, and we spent the day at anchor between a sandbar and El Qatif in about 1 fathom of water. I explored the sand bar on an outgoing tide and caught 2 small mullet, and a number of crabs several burrowing birds. There were terns and sandpipers also on the bar. U-48-18. I also got some snails. Both El Qatif & Tarut Id. are well covered with date palms and hardly look like desert shores. Dahrain <sup>een</sup>, a town at the east end of Tarut Id. is opposite a round fortress about half way between Tarut Id. & the mainland ~~fortress~~. It is round small made out of stone with about a dozen black cormorants on tops. I collected numerous larval fishes under the gulf weed floating on the outgoing tide U-48-18a. Some were recognizable brown blennies which was interesting probably specific to that weed when it was on bottom. I lost an eel pot when the line broke and caught nothing in the eel pot or in a large trap. The bottom had some thin dark brown weed otherwise it was much sand with no visibility or clarity. Larger clumps of weed (1 foot in diameter or so) had anywhere from 2 to 6 larval fish underneath. I saw 2 porpoises in that shallow water.

We anchored for the night about a mile WSW of Dahrain on Tarut Id. We pitched and tossed and rolled to a hard south wind till about 2 A.M., when it slackened. It was one night before full moon and the moon was very bright. No fishing was done.

Apr. 24 - Fairly clear and calm in the early morning with increasing North shamal the rest of the day. We struggled up wind to El Qatif again. Darley went ashore to Thahrain to get a stronger boat. With no boat in the morning, I could not collect but wrote up my notes and packed fish, and slept a bit to make up for last night. In the afternoon, I went ashore with Abdallah to operate the cast net but it was strange to him. Yusif knew a little more, and I finally improved to the point where I got one good cast. Yusif caught a porpoise and I got one mullet near the sand island where I collected yesterday. The evening was cool with continued north shamal and cloudy skies.

Apr. 25 - About 1 A.M. I got up with a sore head and a stiff neck and found the row boat on the sand bar high and dry and the stern of the Palestine hard on the beach, meaning that I was almost standing on my head in the bank. It was calm most of the night, and early morning. We left for Ras Tanura at 7:30 A.M. with sun and fair north winds. At 9:25 A.M. about 2 miles off Ras Tanura we caught a charad on a silver spoon. It weighed  $2\frac{1}{2}$  lbs. and 580 m.m. It was an immature female with a large shrimp in its stomach. It also had white worm parasites in the intestine and flesh (several were preserved). We arrived at 9:45 A.M. The fish was given to the crew. Last evening, I saw a large heron flying over us like a great blue heron. I have a case of the runs today. Stewart had a bad case yesterday. The mackerel had 7 gill rakes in the right arch and 5 in the left. The day was completely wasted with the flies at Ras Tanura; Darley did not get back from Thahrain until mid afternoon. 2 letters from Incile and one from the folks were all to cheer a bleak day. Jim and I went into Ras Tanura for supper and the movies to get a change.

Apr. 26 - A fire with our damn white gas stove greeted us at 6:00 A.M.; so I left a note for Darley to get a kerosene stove.

6:30 A.M. We left Ras Tanura under way due SE with light swells and light NW winds. Several porpoises cited on Ras Tanura point and are about 7:20 at sea. Also a silver fish 3 ft or so long I saw jump out of water, it was shark shaped. A flock of several hundred gulls and terns cited due north several hundred yards at 7:40 A.M.

Clear day without clouds.

Red & white <sup>big</sup> and silver spoon

were dragged overboard from Ras Tanura.

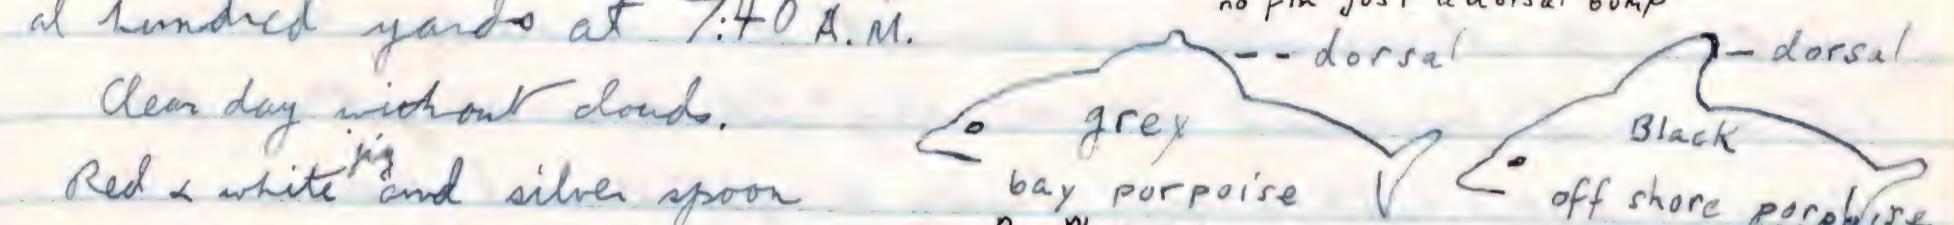

7:50 A.M. Small fish cutting the surface about 20 yds astern; a small school possibly being chased by larger fish. Arrived at fishing spot 7:55 3 fathoms of water, sand & rock bottom about 8 miles S.E. of Ras Tanura, Najwa

Large wire traps baited with "Om" (dried sardines) at 8:30, 8:45, 9:00, 9:10 + 2 sec pots, 9:20, 9:35. The water depth was 3 - 4 fathoms where traps were set. Finely branched coral or possibly some other stuff was growing in large patches on the bottom. It was dark brown in color. The water was blue and quite clear.

Terns with black caps and brown wings sat in pairs on our buoys. They were similar in color to the sooty tern. Hodji Hassan, our captain, calls this place "Najwa" and it is so marked on the chart. It is pronounced Naywa.

Some of the bottom stuff looked too fine for coral and may be a type of plant life, "chin" seaweed or a relative of the sea fans. With Abdallah I dragged over the bottom and got several samples of fine branched coral which is dark brown when alive. The

coral becomes light brown in color when dying white or grey when dead. I took photos of some specimens and preserved a few pieces. At 1:15 P.M. we collected the traps, only the one with the mackerel heads caught any

bay porpoise  
*P. Phocaena*

off shore porpoise

7:50 A.M. Small fish cutting

the surface about 20 yds astern; a small school possibly being

chased by larger fish. Arrived at fishing spot 7:55 3 fathoms of

water, sand & rock bottom about 8 miles S.E. of Ras Tanura, Najwa

large wire traps baited with "Om" (dried sardines) at 8:30,

8:45, 9:00, 9:10 + 2 sec pots, 9:20, 9:35. The water depth was

3 - 4 fathoms where traps were set. Finely branched coral or

possibly some other stuff was growing in large patches on the

bottom. It was dark brown in color. The water was blue and

quite clear.

Terns with black caps and brown

wings sat in pairs on our buoys. They

were similar in color to the sooty tern. Hodji Hassan,

our captain, calls this place "Najwa" and it is so marked on the

chart. It is pronounced Naywa.

Some of the bottom

stuff looked too fine for coral

and may be a

type of plant life, "chin" seaweed or

a relative of the sea

fans. With Abdallah I dragged over the bottom and got several

samples of fine branched coral which is dark brown when alive. The

coral becomes light brown in color when dying

white or grey when dead. I took photos of some specimens

and preserved a few pieces. At 1:15 P.M. we collected

the traps, only the one with the mackerel heads caught any

fish (5 small Lethrinids), and 1 green wrasse in the ed pot. The dried herring does not seem much good for bait. The traps are large and clumsy and not as good as the native ones.

These are large made of chicken wire and concrete iron rods and are not as good as the others.

We left for Ras Tanura about 2:15. It was calm and overcast when we hauled the traps but the wind freshened and the sky cleared as we got under way. At 2:30 & 2:33, 2 charad were brought aboard one on a red & white gig, the other on a silver spoon. At 3:40 P.M. we caught a sharad which I kept as a specimen V-48-23. We soon after arrived at Ras Tanura west pier and all the flies duly boarded our boat. Ed appeared and a butane gas stove was soon installed and more supplies brought aboard. Jim and I ate in town partly to get away from the flies. The night was very calm and we used the light off the boat at a barge some 600 yds. north of the dock, V-48-24. Serranidae, herring, atherinids, were caught, and a few half-beaks, some gars, and other larger fish were present from time to time. The water was clear and the tide ebbing fast.

Apr. 27 - Glass calm this morning early with a bright hot sun. We headed north along Ras Tanura up Tarat Bay to Shmayly id. a small sand island with sand hummocks covered with fleshy poor grass green & red in color. The isle (means "small northerly")  $\frac{1}{4}$  mile long by 200 yds wide about 6 ft. elevation. Abdullah and I caught 2 sand lizards, and Abdullah a herley did collecting with the 15' seine on sand bottom on the north side. Large *C. elongatus* and small mullet were most abundant. Some few small gerrids, baby silagos?, 1 *Platycephalus*, all sand colored. At the northwest corner of the isle there is a hole black reef rock, at the edge of which are numerous porgy; "shati" *Sargus* with spots on the tail etc. I picked up a skeleton of a band headed porgy. There was a considerable tide up

at the north tip with a channel. This afternoon, we watched two native fishermen work their palm stick stake traps. They go right into the trap box which is most closely woven and use a ~~one~~<sup>long</sup> and stretched net scoop net 2' by 3' with a stick at either end and one man wades around chasing the fish into the corners, and scooping them up that way. Out of the two traps on the south side of Shmayly id. they got a possible total 30 lbs. But it was just a day catch and was mostly sardines, a few *Chirocentrus dorei*, 2 puffers, V-48-26, a leatherjacket, a seriola, and several scads. The bottom at the south corner of Shmayly id. was overgrown with long brown gulf weed which was rooted to the bottom. I caught 1 blenny the which was like the ones caught under the drifting weed at El Qatif.

There was considerable tide around most of the island. This evening I fished by night light from the side and caught 3 gar with the lift hoop net, + silversides and small herring.

Apr. 28 - By radio message this morning we were ordered back to Dharhan for a conference on Apr. 29<sup>th</sup>; so another several days fishing was completely destroyed as far as I am concerned. We did a little trolling in the morning and caught on shore out off Ras Tanura. We spent the whole afternoon getting to Dharhan and even got held up by customs at the Ras Tanura west pier because of our bags. The air conditioning in the house seemed very cold in fact uncomfortable at 5 tahar.

Apr. 29<sup>th</sup> - We attended the conference which was almost entirely concerned with the ~~finals~~ check for the fish pier plans. There was hardly any need for Stewart to be there and absolutely none for me. I wrote letters to the folks and Ingle. I was generally in an ugly mood. I went back to Ras Tanura on the 2:00 P.M. taxi, and got to the hotel in time to do some evening trolling with some other fellows.

one shanad was caught. We passed the "steel seafarer" a reefer freight from New York (arrived apr. 25 left N.Y. about apr. 3rd). I saw my museum boxes on barge C-34. All my efforts ever going out to the freighter, and tattling to the hands on west pier did not prevent the damn staff from going to Al Khatar. It is supposed to return tonight, but I will be lucky if I ever see it again, what between Aranco & customs. Complete frustration and delay is the by-word of this place in all matters. It was calm and sultry tonight with cloudy skies and light southerly winds.

Apr. 30 - Calm around 6:00 A.M. with a sudden shanad springing up around 7 A.M. and continuing strong all morning. U-48-27 The crew collected 1 siganas, 11 filefish etc. in the big fish trap for me. The fish however, did not preserve well internally so I cut out their guts.

<sup>'Had at lowt'</sup> We headed for a sandy point about 2 miles north of Ras Tanura in Turat Bay where we anchored very close to shore and spent the day. I set the eel pots and got my first 2 small Remipterans which were a beautiful pale pink in color with silver below. The shanad continued strong all day with clearing skies in the afternoon. This evening we headed back to Ras Tanura to pick up Jim and Ed.

May 1 - Strong shanad continued all day today with dust flying off the dock. We had some rewiring done on the boat by Mr. Evans and helpers. It was another frustrating day partly due to weather and partly due to general conditions. In the evening, we all headed to the same sandy Pt. and even the crew was happy. I set 2 eel pots and 1 large trap baited with Zomole lobsters, and a couple of crabs and having caught the evening before. We fished with the light over the stern this evening and had the most bait fish around that I have seen any night yet including a large bunch of larval fish. Atherinids, dascyllids, and sardines were most common including several half beaks, mole lobsters, goby gabs, and numerous sea snakes

up to 3 feet long. They would slowly swim to the top and apparently gulp air and then swim down rapidly out of sight. I saw no all tied up in knots; may be he was catching a fish. They all appeared to be the same species as I have already caught sand colored with black bands on the little ones, and pale grey bands on the bigger ones. We must have seen at least 3 dozen snakes or more in the two or three hours we were fishing off the stern. The bottom appeared to be sand. It was about 3 fathoms of water and about 50 yds. from shore. I think part of the abundance of fish etc. was because we were on the lee side of a sand spit, and there was almost no tidal current. Hence catching fish was a lot easier. I saw one grey fish about a foot long, but did not get a good look at it. Ed Gurley caught a sooty tern roosting at night on the deck roof, I took a picture of both of them the next morning.

May 2nd - I got a hold of most of my stuff this afternoon which is all at the Ras-Tanura storehouse. Mr. Sanders helped me locate the stuff and we talked fish. It contained fair with strong shanad winds till late afternoon. I discovered a small toadfish in the eel pot but he was rotted, I had failed to see him among the oyster shells. I brought six boxes of my stuff aboard after Jim waged a successful talk with customs.

This evening we returned to the sandy point and had boiled mole lobster "Um al Rubyan" and fried sardines for supper. The 2 inch dascyllids had ripe eggs like the large atlanticids of last night. The tide was fast, and the crabs fewer, and the bait harder to get, but it was tick as last night, tho we were farther off shore. The wind quieted at sunset, coming up again after 10 p.m.

May 3 - We got going about 7:30 with light to fair shanad winds and went to Rakaima and talked with 3 fishermen in a boat

who had just worked 2 traps. We got some bait cuttlefish and gut gals & several specimens, Sillago, 2 gerrids, platycephalus, Chanos, & flatfish. 'Ali (Bu'Awa) from Sanabis, Tarut Id. next to town of Tarut, fish contractor who sells fish to Ras Tanura and buys from these fishermen at Tarut.

At 8:30 A.M. we caught a shark on a R&W miller jig about a mile north of west pier in Tarut Bay. Around 9:30 A.M. 5 large traps set at Hadar ram baited with crab & cuttlefish 1 fathom and about a  $\frac{1}{2}$  ~~mount + 1 + 1~~  
<sup>rock pile</sup> ~~sand done~~ mile north of west pier. It is below iron pilings which are south of our former sand spit anchorage.

We spent the rest of the day in a light just north of this sand spit. Our new captain Abdullah arrived and he proved himself to be an ardent fisherman, and he caught two porches by set line from the shore in to deep water near some rocks. He shelled a shrimp and used the tail on the hook with the hook hidden inside. I set my two eel pots in 2 fathoms of water on much sand bottom, and got parapercis, Terapon and an apogonid the next day. I set a barrel net 1 to the shore in the same water the anchors tightened on the line and it sank; all I caught was a big shrimp, and jellyfish which are

"waitly" small with a messynop of stingers. This evening we [stinging jellyfish] used the light off the stern and got the usual run of Loring, dascyllinids, atherinids, a few larval Loring, and many small 2 in. ("Kentucky blue grass" green) bugs which turned blue grey in formalin the next day. We had one strong squall during the night according to Jim. We seized a sand bar and got shrimp, mullet, and sillago.

May 4- Cleek with light breezes in the morning. The captain caught a seabream 5 lbs., S.L. 48<sup>cm</sup>, T.L. 54<sup>cm</sup>; imm. ♀ with one fish head in stomach possibly an atherinid. I took several pictures of it. The canines are like a mackerel but the molars are like the porcupine.

9 A.M. The boys lifted 5 traps with specimens + 3 large groupers (smallest kept as specimen) largest 52 c.m. T.L., 51 lbs, large crab in stomach unripe ♀ E. taurina

<sup>west</sup> ~~pier~~ had one small blowfish kept as a specimen 448-39. We caught two mackerel east of Ras Tanura, and one large one just off west pier. The other two were caught 4 miles off shore between east pier & Rejma.

We reached buoy #7 about 12:30, and put over our drop lines. The weather was slightly overcast with very light breezes dying to a flat calm in the afternoon. There is about 6 $\frac{1}{2}$  fathoms at #7 with sand bottom. I had two small bites and lost it, then 10 minutes later I got a tremendous fish on the line which pulled then stopped and finally broke the line. It was probably either a large grouper or a catfish. Ahmed caught a gar just as we approached the buoy on a silver spoon. Abdullah caught an ablernes (3 ft.) on a bobber off the boat. The Smiley came out later with a launch no other fish were caught. I saw a small ~~Dussumieri~~ 3 ft marlin or swordfish not far away, and a 5 ft. one at quite a distance. Considerable ablernes were swimming around in pairs or fours skimming the surface or jumping. I think I saw a barracuda but it may have been an ablernes. We saw small tuna or bonito playing around at the surface 5-10 lbs specimens, and a large school of smallish jacks 12-15 inches. Tiny fish were fairly abundant around bits of seaweed at the surface, I saw some 1 inch banded Seriolas but could not catch them; there were also some py with large heads and tan color. I caught one very small banded pipefish.

(88) Pink aurelia jellyfish 6-8" in diameter were very common and there were also some "dot." The water was quite clear, and the gars and ablernes had a deep water blue and bright silver sides. There was not much noticeable tide. We used cut fish, some cuttlefish, and shrimp for bait. We caught quite a few shrimp in the seine last night. We also saw a couple of porpoises at buoy 7, cor-

morants, and sooty terns. We left about 7 P.M. and got into Tarut Bay about 9:00 P.M. Shortly later, bang a slammed hit and in split second light things started off into the bay, but we managed to save all.

May 5- At dawn clear with some clouds and fair shamal wind. Two hours later we had dying breezes and later a flat calm. Our traps yielded very little except 3 fish. We met some fish pot fishermen in Tarut Bay up near Ras Tanara town 3 miles north of the point. They had about 20 fish pots, and 30 lbs. of small fish consisting of Lettrinas, Sargus noct, Dratodus, Scolopsis, etc. Another fish boat the one we got bait from yesterday had a 995 mm. guitar fish male light brown with white spots. They wanted 5 reals for it; it probably weighed 6 lbs. and is eaten. They also had a small barracuda in a debatable condition for  $\frac{3}{4}$  of a real. They had sold their bait. Fishing seems to be rather thin right now. This was probably *Rhynobatos djiddensis*. I had just used up my film at that point and did not have time to reload.

We tried to seine at Shmayly Id. at noon, but the sun was too hot and there were no fish. We went into the dock at 2:00 p.m. to get supplies and spent the afternoon there. I tried some cube root over coral heads but the current was too swift. I tried it at the dock but the water was hard to see in, and the concentration inadequate. Also the tide was too high. We left the dock about 6 P.M. and headed for Shmayly Id. We trolled 2 lines one spoon and one orange & white jig. We caught a small shamal about a mile north of Shmayly. There was a moderate shamal wind with clear sky. This evening we used a ~~May 6~~ <sup>Heavy</sup> light over the stem and I got several halfbeaks one without a break and Jim got 2 small flatfish which were swimming at the surface. Apparently the flatfish were there in their right mind because we saw one or two more. The tide was going out. A number of crabs went by in the sea weed and a couple of snakes; the bait was very thin probably because of the current.

Concerning the native fish traps there are palm leaves on the bottom to hold the bait which is clay mixed with crab and shrimp etc. and it placed inside and dissipates slowly. The traps are of black wire which they believe is better than galvanized wire. Their traps are certainly more convenient to manage than the large company traps. We ordered bait for the morning from some stake net fishermen. Bait is not easy to obtain in quantities with our available methods.

May 6- Calm and clear at dawn. 8 A.M. 17 sails spotted on horizon fishing boats reading for Tarut and Saikat from deep water. About 10 A.M. it started to blow a hard shamal; so our point in trying to get bait became useless. We followed a fishing boat with a shore seine 250 ft. or more with palm pieces for float and stones for weights, and a white thread mesh of about 2 inches stretched mesh. They had a crew of 8 men with at least 3 on each end of the seine. I took a picture of the boat. We went over to see what they had. They were hauling the seine from a deep spot on to a shallow spot and they were hauling down wind. Nearly all the fish were mackerel scad with a few small barracuda, small gerrids, one or two goatfish, 2 new siganids. Then we went to Nejma where there were 2 traps (stake nets) in the sand, and the boat we spoke to yesterday. We got some bait from them 2 cuttlefish, some crabs, and a mole lobster. They had had a rather poor morning catch of mostly small silvers not more than 20 lbs. or so. We ate some of the crabs and the mole lobster for lunch. The crabs were not as good as the crabs in the states rather flatter in taste; I still prefer the mole lobster.

In the afternoon, the shamal increased to about 30 miles or so with a dust haze over land, we had lunch and stayed awhile in a cove next to Nejma. Then we moved back to the anchorage just above the sand spit near the Ras-Tanara road. My trammel net sank again

even with only one anchor. The eel pot yielded nothing. We got nothing off a set line baited with catfish. Night light fishing yielded next to nothing except 1 mole lobster, a couple of small atherinids, and a small scorpaenid, and more green bugs. The bait was very thin. There were snakes as usual and a couple of squid. I saw one small fish, which may have been a flying fish. One gar and one small half-beak were also seen, and a couple of crabs. There was almost no tidal current. The wind continued with lulls most of the night.

May - 7 Continued shamal with dust over the land. The bottom here is a grey muck-sandy-clay or clayey sand with a rooted green grass on it as we saw by what stuck on to the anchor. This is characteristic bottom of a large part of this area of the Gulf around Tarut Bay. Some of the clay got in my eel pot and cemented some of the bait into a hard ball all by itself. With such bottom conditions, any kind of dragging fishing gear is not very feasible in these areas. The grass is short with extensive branch roots, and is apparently a spermatophyte tho it is not now in bloom. By 8:15 A.M., we got under way again towards Shmayly Id which we reached about 8:45 A.M. we continued west then north to the uppermost reaches of Tarut Bay; we reached the oil pipe line across the water at Safwah about 10:15. In the distance beyond was the 5th Avenue road on the sandy shore, and several stake fish traps. The water was all rather shallow and marshy. We passed some fish pot fishermen but they had no fish, and were setting their pots. Another fisherman was headed for the stake nets at the upper end of the bay. We did not go beyond the pipe line because of danger of tangling our rigging with a power line above the pipe line. Another island is indicated on large scale charts just west of Shmayly. Shmayly however is the only island ~~is~~ the upper end of the bay which is not covered at high tide. There are several sand spits

bare at mean low tide in the bay. This morning Jim found the Pegam in the same net he had caught it last night. The dried out it is still a recognizable specimen of the family Pegasidae. It swam with its wings outstretched. I used 2 quts. of poison plus what wet poison there was left over from the other day, and I caught quite a number of fish among a large clump of rooted gulf weed just west of Shmayly Id and a little south. The cubé root dust mixed with water into a thick mud makes an effective brown cloud of fish poison which sends some fish to the surface within 5 minutes time. The brown Bleeding seemed most affected by this poison of any fish except tiny grunts. The crew hauled a fish stake trap and reported Chirocentrus dorsalis in great quantities. They brought back a bucket full of them from 15"-36" in length which they had speared; I kept one which was not mangled for a specimen, U-48-44. I wrote up notes in the afternoon. About 6 P.M. I saw what looked like a small manta ray jump clear out of water. It was possibly 4 feet across at the wings. About 7:30 this evening we tried the 100 foot seine on the north side of Shmayly Id. All we got were large atherinids, Cyprinodon dispersus, small mullet, and one small porcupine; all was just kept for bait. Tiding by night light rendered very little, I collected one large ♀ half-beak with flowing eggs. It was calm during the evening & night.

May 8 - This morning I lifted my 2 eel pots which are set in about 4 feet of water on sand bottom with rooted gulf weed. One had a large parapercid and the other a toadfish. At 8:20, we got under for Ras Tanura west pier for news of Gurley, Yusif, more ice, supplies, and Ahmed to the dentist for a tooth ache.

Poor Jim spent the whole day running around trying to get Ahmed to the dentist, and also get some goods ordered. I sat guard over our goods with the flies and wrote notes and made up eel pot funds. I had a talk with an Italian teacher Mario Bormioli: and he was

just starved intellectually, as are most intellectuals in this outfit. His field was philosophy and history. An arab gave me a small *brother* which he had caught. It had an olive green back and rich yellow stomach in life; by its black markings it appeared close to the species I got from Shwayly Id. From the eel pots I got 1 *Plesios* and several *apogonids*. This evening we moored to the black shelter buoy about  $\frac{1}{4}$  mile South of west pier where there are reported to be flying fish. We saw one about 10 inches long come up under the light but we could not get him. The bottom was covered with fine grass but it was sparse there was sand and pieces of coral rock and about 15 fathoms of water. The bait mostly sardines, a few *channichthys*, and *silverides* gathered around in tremendous quantities on both sides. I caught two more *Pegasids* of the same species. *Aurelia* jellyfish drifted by in large quantities the tide was swift until slack ebb, and the night was calm. We saw a longish black fish with a big head & thin behind which may have been a cat fish. There we also thin long tan fish on the bottom. We got a few nibbles and that was all. approx. position  $26^{\circ} 37' N$ ,  $50^{\circ} 9' E$ .

May 9 - We left our anchorage about 7 A.M. and passed east pier at 7:10 A.M. with clear sky and light <sup>south</sup> westerly winds. We caught two sharks just a little north of Ras Tanura Terminal tanks about  $\frac{1}{2}$  mile offshore within about 5 minutes of each other. 8:30 A.M. abeam center of Refinery area. We are moving around 3 knots with a smooth sea plus a light breeze off our port quarter. "Al 'ailiyeh" at 10:50 A.M. is the fishing spot we stopped at about a mile from shore opposite date palm orchard of Ras al Kaliya. 4 fath. almost was the depth and the water was very clear with coral rock bottom small clumps of branch coral & some brain coral. We got no bites I saw a few small fish, and caught one larval *Tetraodon* on the surface. At 1:45 P.M. we headed back because we got no bites. The wind by 2:45 became moderate S.E. with small white caps. By 2:00 p.m. it had calmed down again to a light breeze. We caught two more mackerel about

2 mi. offshore, the boat at 3:45 P.M. was caught a little north of the refining area. A black grouper was caught over coral & grass bottom in about 2 fathoms on the orange & white jig. There were 2 strikes on a hand made crab jig with teeth marks; no fish caught because there was no give to the line or the pole. We trolled 4 lines both ways. We sighted several <sup>small</sup> schools of small tuna with white terns diving at the bait, but as usual we had no luck in getting strikes. We trolled around buoy 7, and got a strike and caught a three foot barracuda, U-48-50. Then we moored to the buoy and Abdullah caught a *Lethrinus*, U-48-51, and that was all. There were quite a number of sooty terns on the buoy, about 30. The wind increased from the ESE to squalls and white caps by 6:30 P.M. when we left the buoy and headed back to Tanut Bay which we reached by sundown. We had a rough night with swell from the south and strong winds, so we did no night fishing and anchored  $\frac{1}{4}$  mile north of west pier.

May 10 - Strong southerly winds till 10 A.M. with a high tide, and then it became a flat calm with a very hot sun till 4:00 P.M., when the shark came up and blew moderately till 8 P.M. and then strong all night. We wasted a whole day in at the pier again today to meet Garley and get a few more supplies. Jim and I went into Ras Tanura for a shower and a shave. This afternoon, we picked up 3 of the big traps 1 mi. north of west pier in branch coral bottom. I obtained a number of angel fish U-48-52, *Hemiodus*, a parrotfish etc. Then we moved in shore for the night, and had the best night light fishing yet. Also I caught my first fish by baited hook & line in Arabia, a small red-gill *Lethrinus*. We saw 2 small soles swimming along at the surface. Yusif caught a small barracuda; Ahmed got 2 snakes in the circle lift net. I got 2 long white flat worms writhing near the surface about 2 feet in length in life. They spat out their radulas when put in formalin. There were even barnacles on the snakes. We also got 2 more *Pegasids*. The ever-

ing was actually more raised than the others.

May 11 - Continued strong shanal. Yusif caught a small nurse shark on broken up gut gut. In one eel pot I caught 70 small *Tetraodon* 2 - 4 inches, 4 apogonids, 1 Faskar, 1 *Lethrinus* (red gill cover) in an overnight set. Since I had so much else to manage I saved only 2 *Tetraodon*. It was a wire funnel trap. The cloth funnel trap caught only one apogonid. A pipefish mysteriously appeared in the bottom of the collecting can; all I can think of is that it was coughed up by the shark. We also caught a blunt head grunt. Then we moved into the dock all day to get our rigging changed over to the Tarat-jiggers. The wind blew hard all day. I swatted flies and wrote up notes.

May 12 - Fair wind continued shanal winds. Last night the we went to the same place as before the fishing was poor with scattered bait and cloudier water. I caught one rigand floating at the surface like a frog in a pool. This morning we went into port again to see Gurley and get Ahmed straighted out. Then we went out and picked up the big traps (four of them) the most recent baited one had only 2 small fish; one almost without bait was loaded with 8 rigands, a tutjams, several chaetodons, angelfish, etc. I had a case of the runs so did not feel so well. The eel pots in the morning place left over night yeilded 2 troutfish, and some more *Tetraodon*. In the afternoon, the shanal increased with a cloudy sky, and even a few drops of rain. I felt worse till late evening; we stood in at west pier tied to pipes 100 yds south of the pier to pick up Ahmed when he came back from Shahrain. I wrote a letter to Fuile.

May 13 - At 2 A.M. I almost rolled out of bed as the boat turned over on the starboard side, because the tied had gone out. I got in Gurley's bed for awhile till it straightened out.

No equipment went over the side. At 5 A.M., Abdullah captain speared a *staiti* ♂ 8 lbs 595 mm. S.L., and 69 mm. T.L. with a long piece of goat skin in its stomach. The testes were yellowish and small but were more the shape of testes with sharp edges and no blood vessels. They called it a male because it was more elongate, and less stocky. The day was spent in at dock getting a few supplies, supervising work on the Tarat. I wrote notes and wrapped fish specimens all morning. 8 gal. tank in box #6 got completely filled with fish in formalin, and #22 with a trawl net were returned to the storehouse. A 55 gal. drum of formalin was picked up and box #13 with mason jars & rotenone. Mr. Sanders and others were very cooperative. Jim and Mr. Sanders cleared it thru customs, and it took the usual amount of time. It became calm and hot from 10 A.M. on, but the shanal came up again before 7 P.M. with moderate winds. This evening we anchored 200 yds. from shore 1 mi north of west pier. There were snakes plentiful as usual and the bait was scattered and often became heavy like a movable cloud under the light. It consisted mostly of herring and dussumieriids. Jim speared a squid with his spear. There were several blue crabs and 1 mole lobster caught. I caught a small scorpaenid. We saw several larger fish like small barracuda, and we saw one fish with black and white band which was longish; but it went quickly. No two nights even in the same place are the same for the fishes.

May 14 - Calm and clear at dawn. The eel pots yeilded *Tetraodon*, *Lethrinus* (red gill), *Diplodusis* with the moon band, and one parapercid. I kept one parapercid and one of each of the others. We picked up 2 of the last traps in water and got blunfish and several parrotfish, *Plectosygnathus*, filefish and porcovies. We rounded Ras Tanura pt. at 9:30 A.M. in a flat calm headed north. Around the boat in the morning I noticed a small school of Scomber jumping about close to shore. We reached the Refinery area at 10:45 A.M. Small schools were in evidence of Scomber. At

10 A.M. a shanad was caught about a half mile offshore on the white & blue jig. We reached our destination at 1:30 P.M. off Ras al Kaliya about  $\frac{1}{4}$  mile off shore in 1 fathom of water. We passed over a rock ledge just south of Ras al Kaliya then it changed to stony branch coral which I had mistaken for gross sutton, before other sand & scattered branch coral where we moored. Ahmed and I rowed ashore we passed over hard sand bottom, branch coral clumps (small), sand & coral rock, hard sand coral rock and brown fine leafed algae (about 1 foot long), then hard sand to the shore. The water was 4 to 6 feet deep up fairly close to shore. We found cattle bones abundant on the beach one was at least 9 inches long. We just put 100 yds of water between us and the customs officers or coast guards they wanted a "chit"; but there was nothing they could do about it. I tried to poison some branch coral with cube root (~~two~~ quarts) one small wrasse turned over about 6 feet down and that was all. I saw angel fish (blue & yellow type), *Pomacanthus*, *Acanthurus*, *Abudefduf marginatus*, *Pomacentrus* (black), wrasse, a muraen or two, porgies of several kinds; also there was a small school of jacks with hard scales & scribble mouth (like those mackerel scales) one was over a foot long. Over sand bottom I saw a large sting ray with a thick tail and a wing spread of about 4 to 5 feet. Abdulla tried to spear him but missed. All pots and traps were set and baited on branch coral and sand bottom. A shanad came up about 6:00 P.M. with moderate force but it lightened by 10 P.M. It was cloudy and calm in the afternoon. The boat rocked and it was too windy for successful night light fishing. In fact we saw less fish than any night hitherto; it was all small atherinids. On our way to Ras Kaliya we could see many fish swimming on and over the bottom. There were many small porgies, angelfish, and a considerable number of fat sided parrotfish 8-10" long.

May 15 - We hit bottom about 2:30 A.M. at ebb tide; there was less than 2 fathoms and high tide, and less than a fathom at low tide. We were pulled on the anchor a bit, and we were clear. Fortunately the night was calm. We had the traps picked up in the morning. The eel pots were empty; one trap on sand and weed bottom yielded one catfish, U-48-60, the others had nothing or one or two small *Lethrinus*, or fastkar porgies. The catfish was beaten up, but good enough for a specimen. We got under way about 7:30 A.M. with grey skies and a calm. We headed back to Ras Tanura, and caught 2 barracuda off Ras Kaliya. We hit a couple of squalls about 9 A.M., leveling out to a light shanad about 10 A.M. no white caps. At 10:15 A.M. off buoy 5, we went thru a large school of "jibbabah" without any strikes. A couple of hundred sooty and common white terns were flying above and diving down. 1 mile south of buoy #5 we caught a big shanad on the red & white jig. 12:00 P.M. light airs & grey sky. 2 miles off refinery (Ras Tanura) we caught a shanad at 12:10 P.M. Also 3 schools of jibbabah were seen with terns on top. 12:17 another shanad  $\frac{1}{4}$  " west of buoy 7 & N Miller, light airs. At 12:25 P.M. we caught another shanad with 3 small scads (3-4") inside. One scad was quite fresh still. Shortly after 1 P.M.; the sun came out and about 1:30 P.M. a light shanad sprung up again. We pulled into Ras Tanura at 1:45 P.M., and news was that all drama was out looking for us. And so it goes; Yusif was also back from Bahrain. Clear in the afternoon with light shanad winds; we left the pier at 4:30 P.M. after placing orders to be picked up the next day. We headed for Shmayly Id. and hooked to small barracuda along the sand bar just north of Shmayly Id. which is under water. I added up and check my collection with Blegrado and find I have observed 79 species, and have in my collection 69. I also started my monthly report to Dr. Schultz. After dark, using fish for bait, Ahmed pulled in a small shark, *Carcharias menisorrah* - U-48-62. A 10" *Lethrinus nebulosus* was also caught,

but not kept. Night light fishing did not yield much; just some larval fishes. Large otocinoids were also seen and half beaks, a pipefish and a Pegasus went by, but were missed. Also a small shark came by under the light about 2 feet long. Crabs were fairly numerous.

May 16 - I lifted the eel gots this morning. They were placed near the gulf weed banks. Only one yielded anything, a toadfish, Pomacanthus and Tetrapora. It was clear and hot and calm all morning. Abdullah, captain, little Yusif, Ahmed, and I went ashore armed with a throw net and a 25 foot seine. Abdullah caught a tern like the Cayrian tern ~~Sooty~~. It had a grey back and white below and are apparently breeding now as we saw some eggs and young birds. I got a young bird which was pickled. Seine collections were made around the island in sandy spots, all were included in one collection 1 goby, 1 blenny, 2 silvers, 2 eels, cyprinodon, Chelon, Sparus etc. I saw 1 1/2' guitar fish take off into deeper water. We did not get any Platycephalus probably because the tide was still low. I saw some more of the same lizards on Shmayly that I had collected before. At noon, we saw a Chamed jump clear out of water not over 150 yds., behind the Palestine. We headed back to Ras Tanura about 1 P.M. to pick up supplies again. We worked on some of the fish rigging for the Tarut, and hung around till evening. Everything was screwed up as usual without going into the gory details. Curley appeared in a new hat from Stehren for about 10 minutes. About 7 P.M. we headed back for Shmayly, and at 9:00 P.M., young Yusif landed a shark on hook & line, 72 cm. t.L., 5 lbs. ♀ with young ready to be born, U-48-65. Another one a ♂ about 18" was on the hook the next morning which was also included as U-48-65. The night was close and calm interrupted with sudden gusts of hot desert wind.

May 17 - I got up about dawn this morning, and used cable net to collect at low tide. I collected most of the fish from a gulf

wild area, 4 blennies from a coral rock pool, and a flounder lying still alive on the sand. I saw closely this morning those fish that live in holes in hard much sand. They are apparently commensal with a curious mole shrimp which digs the burrow and the fish lives in it. The fish looks similar in appearance to a large goby something like Periophthalmodon; it is definitely not a parapercid as I thought might be the case when I first saw them in deep water (see p. 28). I tried to poison a couple of tarpons but met with no success. About 10 A.M. we headed back to west pier to check up on the Tarut. We spoke to some pot fishermen. All they had was about 20 lbs. of small porgies, faskar, etc. and several blue crabs. Next we spoke some stake net fishermen who had a couple of bushels of cuttlefish and crabs, and sold us about a half bushel of bait for 4 reals. They also coughed up a small (Chiloscyllium griseum) which was a reddish tan in color. We reached West Pier about 12 noon. The Tarut crew was out for lunch. It was windless but and sunny. We tied alongside the new fish pier just north of west pier, and waited till about 1:30 P.M., before all the Tarut crew assembled, and Jim shoved off with the Tarut I remained with the Palestine. We headed S.E. for Najwa with northerly light airs and a clear sky. We hauled ~~the~~ one lines and passed several schools of Scomber (Tibbabeah) the usual size about 20" jumping around in the water with terns diving from above. No strikes from them as usual. We arrived at Najwa at 3:30 with a moderate shamai wind & a white A buoy 1 mile N.E. of our anchorage. We anchored in a wide sandy area with a V shaped band of reef on either side and straight ahead of us. We anchored in about 3 ft. of water with mud sand bottom. Soon the Tarut came up with Jim along with 4 Arabs. We set the 6 traps at Najwa, and then returned the Tarut made 15 3/4 R.P.M. towing the Palestine dead ast. with the Palestine running the Tarut towed just barely 16 1/2 R.P.M. full speed.

Jim figured 8 knot with both engines running and 5 $\frac{1}{2}$  with just the Tarut. About 2 miles east of Ras Tanura the Palestine looked into a large *Racconichthys canadensis* "sikra" around 30 lbs.; it broke off the hook and was lost. Black color on top and light below and protruding lower jaw rather confirm that it was this fish. Schools of Jababek were passed on the way back without a strike. No such either for the Tarut. We left Rayyah about 5 P.M. with a moderate shamal wind and white caps. The shamal increased and around 7 P.M. it became cloudy and quite cool. During the night the wind came up and died in squalls. We slept on deck, and the crew on the deck roof. Under the night light, there were mostly just young herring with some larger herring like fish underneath.

May 18 - Fair and clear today with moderate shamal winds. This morning, I got only one plesios (brown) out of the eel pots, and I ran one poison station on mixed sand and gulf weed bottom in an area surrounded partly by the coral rock at low tide. I got a *Siganus sutorius*? (tan with small light blue spots) which most approximates Bleeker's species. A couple of small spotted groupers, gobies, blennies, porches, pipefish, and the usual brown *Plesiops* and green wrasse turned up. *Plesiops* (brown) seems to be hit the first and the hardest by coral root, then pipefish in a few numbers, green wrasse, and *Acanthopagrus thursteri*, young *Peristedion*, yg. *Tetrapodus*, others other fish are affected more or less incidentally. I used 2 quarts at once in a thick mud and a more confined area which seemed to help. The water was 3" - 2 ft. deep. I also collected some brittle stars from some brown fleshy tri-cornered sea weed. I did some observing under water with the face mask and went over a considerable area of a short grass bottom from 2" to 6" in length in much sand ~~W W W W W~~ also mixed in was scattered fleshy green grass with runners not single as the thin grass.

I observed more closely the shrimp and the hole fish see (p. 51) and the shrimp is dark about three inches long and shaped roughly like a fresh water crayfish. The shrimp is usually busy running back and forth dumping a load of mud out of his hole. Two holes were 1 to each other so that the shrimp from one hole was actually dumping his mud into the other one's doorway. This, however, caused no fight, but they both continued carrying mud out furiously. Each hole had its sentinel fish. One was a *Dascyllus*-like blenny of about 3 inches the other I am now sure is *Periophthalmodon* because of the superior eyes blunt nose and almost stalk-like united ventral fin; specimens were three to possibly 4" inches in length. Smaller specimens of this hole blenny I believe to have collected both today and yesterday. So far I have been unable to poison them. The *Periophthalmodon* do not seem to live in less than 3-4 feet of water at dead low tide, whereas Bleeker's fish were obliging enough to be on dry land at low tide.

The morning was spent in fussing around rigging the lines and tie-lines for trolling on the "Tarut" which came alongside. Jim and I did it more or less alone, since we were the only ones who had even a faint idea of what we were trying to do. Though cool at dawn, it was not during the morning, even with the shamal wind. The shamal was stronger in the afternoon.

 This weird creature vaguely resembles the small jelly or spine covered spider crabs found in the  triangular brown weed this morning. Specimens of plants mentioned were preserved in formalin.

In the afternoon, the shamal increased gradually going eastward until by 5 P.M. we had a stiff S.E. wind. I wrote notes and packed fish specimens in the afternoon. An airplane overhead and a note brought us into the pier and eventually to Dhahran. The Tarut left us to get the crew's food rations. The night became calm later on with occasional squalls.

May 19 - We got up at 5:30 A.M. this morning and it was almost

a glass calm. We were tied up to the fish pier. Last night I got a nice specimen of a ♀ flyingfish from an Arab lad off one of the laundries. It had flown on board; it had ripe gloving adhesive eggs. U-48-69. I finished a monthly report to Dr. Schultz.

The trip to Al Khobar in the Tant was very calm about 3 hours 6:30 - 9:30 A.M. It was hot and rather humid. I saw a couple of schools of *jetabah* between Ras Tanura & Najma.

The A. marker at Najma was on dry sand this morning at low tide, which explains the dries 4 feet on the chart. It might be a good place to collect with poison some time at low tide. Just north of Al Khobar we saw great numbers of large, 1 foot in diameter, solid white jellyfish similar in shape to the one figured on p. 20. We saw one small sea turtle about 3 feet. We saw a large flock of cormorants, and terns here and there. I got a hair cut, shower and shave, and wrote a letter to Lucile and mailed it and the one to Dr. Schultz. Later Jim came around and we went to see Ed Burley in his temporary office in the brick building. He was in good spirits, and we planned the work of supply for a fishing trip for Mr. Sulaiman, the Saudi-Arabian finance minister, to Jez Jannah for an overnight trip with all the trimmings. The trip developed into this larger idea just today. Besides being interesting to visit the island; it will be good to meet Mr. Sulaiman. The shamal blew all afternoon and evening. The shamals may be our stumbling block for the trip. This ~~evening~~ <sup>evening</sup> I went to the movies just to pass the time away.

May 20 - Clear and hot today but slightly cooled in Dhahran by a windy shamal. All day was spent driving around picking up supplies for Abdullah Sulaiman's fishing party. I got the Arab food and bedding, and Jim got the American food and Ed got some details worked out. The "Tant" left Khobar pier bound

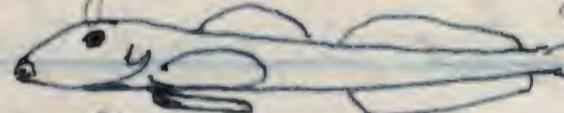

for Ras Tanura at 5 P.M. loaded down. Jack Mahoney, editor, of the Sun and Flare, spoke with me, and wanted a little story about me and my purpose being over here, other than "a butterfly catcher" which reminds me of the Dhabran (fly) salute. I also spoke with Jim Knight, Jim Stewart's roommate; he knew the Keddys in Washington, and the Friends' Meeting. I copied down the companies standard rations for Arab workers which I thought would be interesting. 1 man for 1 day at the Arab Commissary:

1 oz tea	4 oz. lentils	2 oz. salt
1 oz. coffee	1/3 oz. onions	1/8 oz. cardaman
3 oz. sugar	1 lb. rice	1/2 oz of cloves
1/2 lb. flour	1 lb. dates	
3 oz. ghee	1/4 oz. Curry powder	

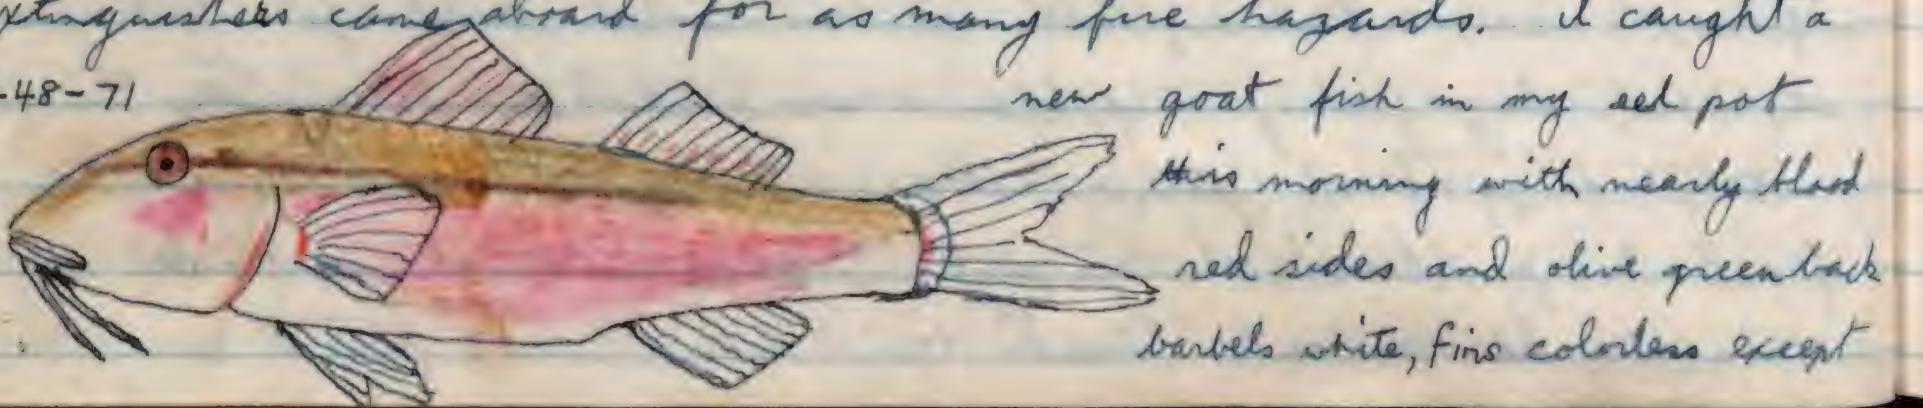

I thought of these words tonight alone in my room. 'In the presence of God and these our friends, I take you Lucile Mendum to be my wife; promising, with <sup>divine assistance</sup> ~~God's grace~~, to be a loving and faithful husband as long as we both shall live.' It seems now that I am away that I try not to think of her too often, because it is no joy to be apart. Nevertheless, her bright eyes and ready smile pervade my thoughts daily.

May 21 - Jim and I left Dhahran by taxi at 7 A.M. and managed to miss the worst heat of the desert. We stopped at the storage house. Jim did some telephoning, and I got some cuté root and my two harpoons, and wire metal screening. There was a shamal and clear sky most of the day. I got myself a head ache from the heat and diving into ice air cooled buildings. We spent the whole day getting supplies aboard for the trip. The Tant nearly dropped off its propeller, and whether or not it will be fixed is problematical. The shaft was broken, but it was hauled up on a pier derrick and fixed by 10 P.M.

May 22nd - The shamal continued with intensity all day with white caps on the bay. It quieted a little at sunset. We remained tied to the fish pier. All the tent tied by four pieces on our roof would probably make it easy for the Palestine to capsize in a rough sea. The fish pier was frequented a good part of the day by arabs, and one fellow was having good success catching gerrids (6-8") with sand worms for bait and small hooks. Abdullah also caught several this way. Some coast guard officers came aboard for tea and talk this afternoon with Jim. I caught a small filefish near my eel pot line before dark V-48-70, and I also caught some <sup>small</sup> halfbeaks etc. under the light at night.

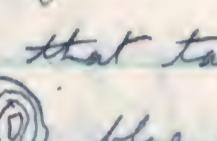

May 23rd - It calmed down some last night and early morning, but by 8:30 A.M. it was clear and blowing a strong shamal still. It did not calm down till evening, and it was relatively calm all night. The crew fished off the fish pier with small hooks and small sand worms for bait, and they caught 5 Periophthalmodon for me that way. I caught a lot of herring and small scads with the hoop net in the afternoon. The night offered fishing including a new specimen  of Callionymus? I also caught several small bananuda about 2" long. Also I saw 2 spotted eagle rays, Aetobatus, swimming offshore. They were a scarce 2 feet in wing spread, colored much the same as the west Indian species.

May 24 - Increasing shamal winds and clear sky wind more westerly of north. Specialists boarded our boat in numbers as usual but offered no useful suggestions regarding our leaking stove. Then about 6 fire extinguishers came aboard for as many fire hazards. I caught a new goat fish in my eel pot V-48-71

the first dorsal. It continued windy all morning and until late afternoon. I wrote up notes and wrapped fish specimens in the morning. In the afternoon, Abdullah Suliman and party came out on the pier a few minutes and we chatted with them. They did not have much time. I also talked with Gary Owen and thought he and Abdullah want me to come over to Jiddah any time. In fact Gary Owen said I will be seeing you in Jiddah, and Mr. Suliman said he would show me the kinds of fish there. Mr. Suliman still wants to go fishing and is apparently willing to wait for the weather. We barely managed to get dressed and have Abdullah put up the flag before they were on top of us. I sent a letter to Incle today and also, a character sketch of myself plus explanation of my mission over here to Jack Tahoney of the Sun and Flare. I also received news today from Incle of Larry's intended marriage on June 6th to Marian Williams; thus endeth the bachelors in our end of the family. If I had not already been married to a wonderful wife, I would have felt a very definite pang of jealousy for Larry's happiness. Jim and I went into Ras Tanura for supper and I got a travelers check turned in for reals.

May 25 - It was calm most of last night, and a moderate westerly wind set in about 7 A.M. The sunrise was dusty this morning with a silver sun burning through the dusty haze; as the moon just past its full was hazy last night. Today was fair with light winds most of the day. We could have gone off but the weather prediction was for a bad shamal, and no definite orders to proceed from Shahran. Needless to say, I am tiring again of waiting. We put oil on board, and got the stove fixed again. My eel pots continue to yield fish, but around here I get more during the day than the night. Apogon thoracicus seems to be the only one that runs in at night. Yesterday, I got 9 blunt head porches

in 2 pots just in the afternoon. I gave most of them to the crew. I used the face mask between the jippe and the fish pier this morning and went over mud sand with light grass bottom. I saw holes with *Periophthalmodon*, and free swimming saw 3 inch *Sargassum noct*, a gerrid 10", several 12" *Sparus curvirostris*, and large schools of black spotted herring, and the small jacks swimming upside down under the boat. On one rock with  that tan oyster like weed I saw a ½ inch pomacentrid bright  blue above and deep yellow beneath just like young Pomacentrus in the W. I. I would not be surprised if this was merely the young of the large black pomacentrids which are common around here.

In the afternoon, I rowed up to a hard sand area with brand coral over it. I observed with face mask the predominant species there the Faskar, Lutjanus with a black spot under the second dorsal, Scolopsis personata, Scolopsis (striped), and lined Pedates?, black pomacentrids, black (Sparisoma) blennies, black Pliceps, green wrasse, and that was about all. I wrote a letter to Gaile and also to Larry.

Around 5:30 P.M. I went out in the Tarut around east pier, and in an hour we didn't even get a strike. There was a thick dusty brown haze all over the gulf and visibility was less than ½ mile. We saw both kinds of porpoises in great numbers. We also saw gibelot, and I saw what looked like a small marlin jumping out of water tho I could not see a bill at that distance.

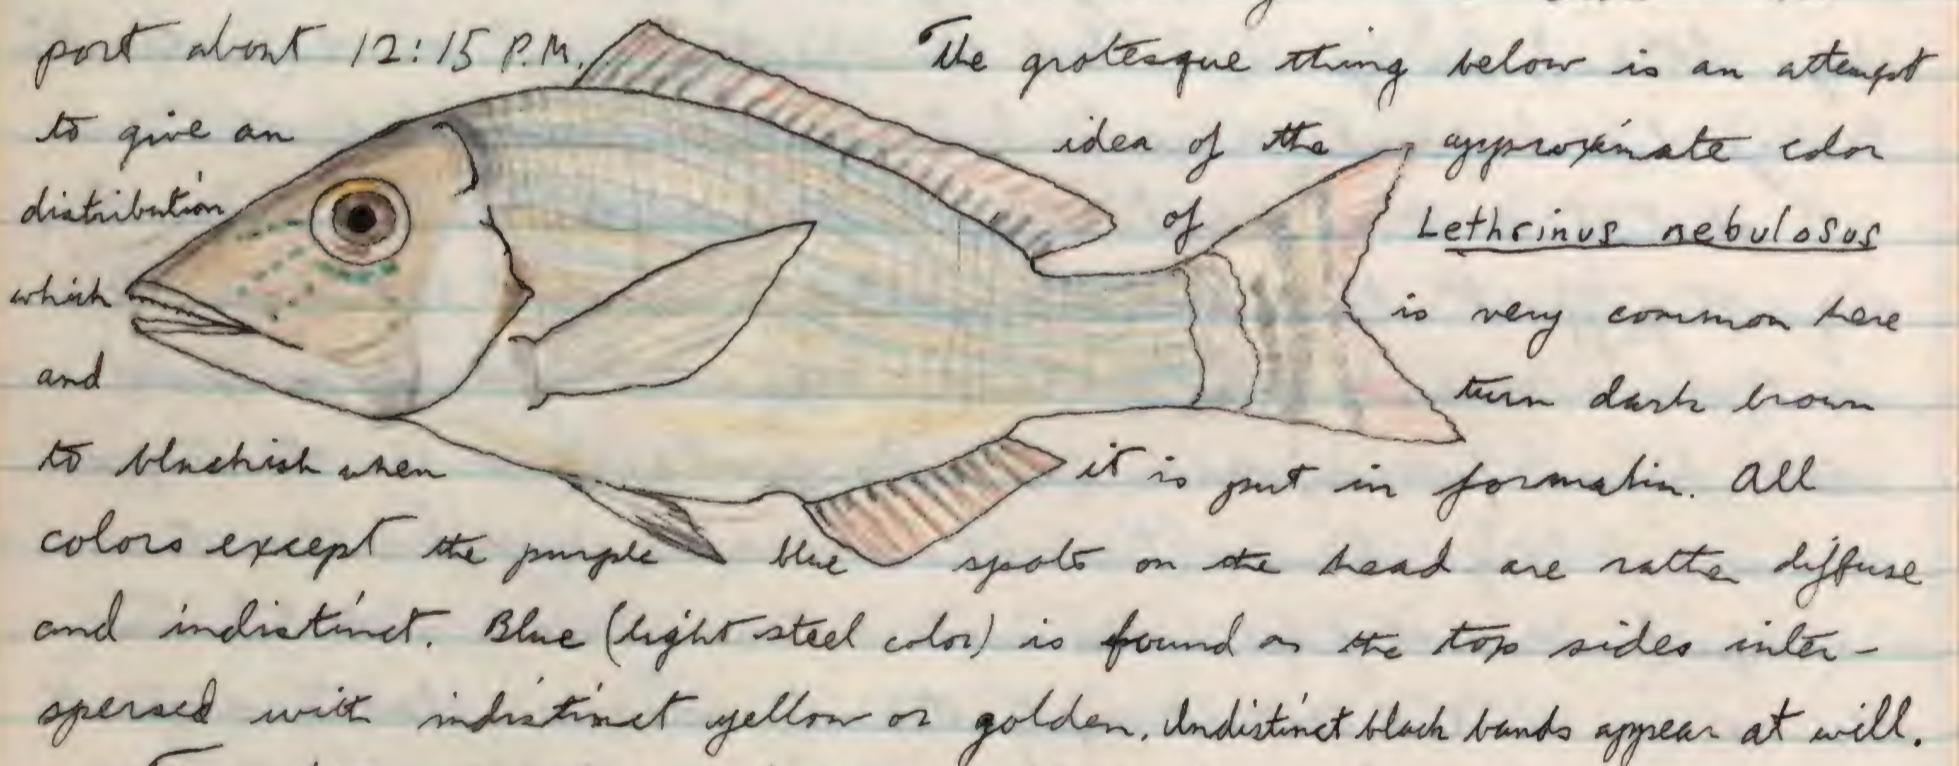

This evening, I talked with Ted Ellers, Gen. Engin. Sect. 2251 Sh., who has done spear fishing at Half Moon Bay. We may get together some time. It was calm and extremely damp from dew tonight. In fact everything on deck got soaked. A light breeze made us feel cold because of the dampness, and we slept below where it was drier.

May 26 - It was flat calm this morning and the sky clearer of dust with cirrus clouds. I tended the eel pots and lost one right off the end

of the fish pier. At 7:30 A.M., I left on the Tarut for Nagwa to pick up the wire traps. When we reached there we circled around about a half hour and Abdullah must have spotted them, for we stopped and in 20 minutes 4 traps were recovered, and the other two after further search were given up as stolen. We reached Nagwa about 8:15 A.M. The water was thick with aurelia jellyfish and several dabs. I swam around with a face mask a bit but not much over sand bottom. Just before reaching Nagwa a charad struck but fell off. After leaving Nagwa about 9 A.M. we lowered both jig poles and headed for buoy #7. A fish pot boat with 6 crew and one funnel fish pot was there and a galboat also with awning canvas. About 11:00 A.M. between buoy 7 and East pier we caught a charad 8 lbs. on a bone jig. Between east pier and Ras Tanura point we hooked a tuna, about 15 lbs., with a blue and white jig(?) and 4 oz. weight. light east winds and clear sky. It had average sized black tuna pectorals and the characteristic bronze lateral faint stripe and dark blue back, but that was all that I saw. I pulled it up outside another line, and in attempting to gaff it it threw the hook; this was about 12 noon. We went back several times but had no success. The boys fried some hamar for me, which was pretty good. Now re: the traps there were 2 large hamar (1 was 68 cm. S.L. and weighed 6 lbs., it was an unripe ♀ with lots of fat bodies inside but no stomach contents). The other one was about 5 lbs. with empty stomach. There were about 6 six small ones, several small lethrinids, parrotfish, 1 angelfish, 2 Plectroichthys, 1 Siganus, and more important there were several dead fish mostly Hamar and a half gone Hemiodus and several partial skeletons. This leaving the traps for any period of time over one or two nights is not good. We reached the fish pier again about 1:30 P.M. I wrote notes and wrapped piles. We took on supplies again in the afternoon. Light easterly winds in the afternoon.

I did some night light fishing off the Fish pier and got a few specimens of common stuff shiners, herring, etc. and larval percoids.

May 27 - We are still waiting definite word from Shabran. This morning was fair and calm; thus 3 good days we being almost wasted. Saif, the pearl diver, on the Tarut recovered my eel pot this morning and it contained two 25 & 26 cm. groupers, *E. tawina*, and one black *Plesiops* and an *Arognathus thurstoni*. I gave the groupers to Saif as a bakseesh. I left on the "Tarut" with crew at 9:45 A.M. sky almost clear with light cirrus clouds and light easterly airs. Slightly stronger south easterly breeze came up around 10:30 A.M. but remained light. We trolled around the pier (east) and out near buoy #7 with 7 lines one with 1 lb. wt. We trolled thru a couple of schools of *Jabal* and we didn't even get a nibble. It was the worst time I have seen yet. We headed into port about 12:15 P.M.

This afternoon, after telephone calls, and various people coming aboard, we got under way to Tarut upper Bay. Then the crew wanted water, and we stowed in the sides of the boat port side on a pipe barge off west pier. When they got water, the tiller rope ceased to work (it became slack, hence another delay). We got going about 6 P.M. with moderate easterly winds.

The Tarut went aground just beyond Za'al (Shmayly) Id. and

it was so late and the Palestine was going so slow that we went back to Za'al to anchor for the night. We all fished over the side with the night light, and the new specimens were 36 *Dermogenys* (<sup>Hemicanthophrys</sup>) small halfbeaks with large orange tan ventral fins far aft near the anal, and they stuck out like large pectorals and gave the appearance of making the fish seem to be swimming backwards. We also caught numerous small bill fish apparently both *Ablennes* & *Tylosurus*. We saw some spotted or rather mottled fish (8" approx) about the build of a goatfish. They kept their distance from the light, however, and did not give us a chance to collect them. Crabs and one cuttlefish came along and were caught. It was moderately damp with a fair easterly breeze. At 2:30 A.M. I got cold on deck and needed a blanket, the wind was rather breezy then.

May 28 - Today was fair and calm at dawn. My eel pots only yielded one *Arognathus*, *Sethrionis nebulosus*, and a couple of crabs. So I left them in it. We left after breakfast back to the Fish Pier to meet Durley just up from Shabran still with a bad cold. The gist of the visit was that we have to come to Shabran again Sunday partly to unload the stuff, and partly just because. In the morning I set the eel pots, and then cleaned off the bottom of the row boat which was composed of green algae (inch long) zone almost brownish. It was filamentous and slimy to the touch. actually there were very few barnacles. The bottom of the Palestine, however, has just about everything from barnacles to algae. I also wrote notes and wrapped specimens, and started a preliminary report of work to date at request of Durley. This afternoon, we unloaded the 2 tons of tent frames off our deck roof, and the boat rose. Then about 3:15 P.M. we headed up Tarut Bay. Jim sprained his wrist by skidding on the wet deck early in the morning, and went to a doctor

during the morning on shore. The breeze stiffened from the east around 4 P.M. and there became light white caps on the bay. In the eel pots near the fish pier this afternoon I got a 4" parrotfish, 11 green wrasse, ♀ *Lethrinus nebulosus*, and 1 *L. miniatus* (with red gill). This picture of *Lethrinus* U-48-76

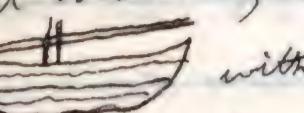

*miniatus* shows the dark phase recently dead in formation of the fish plus the red gill covert and smaller eye. *L. miniatus* is generally lighter colored than *L. nebulosus*; in fact it is almost silver at times. 2 specimens; 1 of each species are being kept for later comparison; the one with the tin tag U-48-76 is *L. miniatus*. We reached Safwa just south of the Qatif pipe line where we cast anchor in 1½ fath. of water. We anchored to the lee of a sand bar which is perpendicular to the pipe line. I rowed ashore and took a "shoal" around the beach and saw 2 sting rays in about 4 feet of water with approx. 1 foot discs. There were also several schools of young halfbeaks. When I came back aboard I took the air and water temperature 34°C in the air with wind blowing and it feels comfortable, and the water was 31°C and does not feel particularly warm or hot. Young Yusif caught a 20" with 3 "mooth" shark on fish bait about 7 P.M. We used the usual light and dip net over the side and there were halfbeaks and a few small herring, and gradually huge schools of *Triacanthus indicus* came into sight and the crew caught well around 75. Abdullah and little Yusif were catching them like mad for about an hour. The fast swimmers *Triacanthus* are rather stupid. Their guts were full of small hard stuff shells and small crab claws, etc. They were nearly ripe males and females. In fact a translucent gel exuded from some but it seemed hardly white enough for milt. Their eyes were like transparent red marbles, and the skin like sand paper.

May 29 - I moved above deck about 1 A.M. and waited and slept

till 3 A.M. for low tide. I headed in the row boat for the sand bar to the east, where I saw 2 sting rays swimming along last evening. I walked up or down the sand bar for quite a ways until I saw and speared a *Platycephalus*. The bottom varied from sand to much sand and some bottom with short grass. It also went over some bottom in 6 inches of water where I saw one small *Percophthalmus* and many holes; it was hard bottom, and small blue crabs about 2" were very common. I finally caught two ~~Rhinobatos granulatus~~ and another *Platycephalus* and even speared a small sillago in a channel than the sand bar. Fish seemed most abundant at the mouths of two sand bar channels. The smaller *Platycephalus* had an unidentified fish dead in its mouth. It was flat calm at 3 A.M. with a moderate slight channel at 5:30, and nearly calm shortly afterwards. The night was clear with moon and stars, and there was a rather heavy dew on deck.

After breakfast, I picked up the eel pots, and found one small grouper, an apogon, and several ~~Tetrapon puta~~ *Tetrapon puta* who were grunting faintly (like sea robins). I preserved several of them. At 7:30 A.M. we saw a grey porpoise and slightly later a large 3 ft. *Torpedo* ray jumped out of water twice. I saw it the second time; it looked like a mussel grey sack with a stoutish tail. The tide was coming in. Also there were large pieces of sea foam (like little sievers) floating around in the water. We left our anchorage about 8:30 A.M. and headed back for Ras Tanura. I examined the stomachs of 5 *Tetrapon*. One had 2 fair sized 2" chima (apparently a spawned out ♀); the others had pieces of small fish; or a possible silverside. The varied from 3" to 4" total length, and one of the smallest was a mature ♂. Jim and I had just about discussed the uselessness of trolling in shallow water on a calm hot day; when at 9:45 A.M. Ahmed started tagging with a fish. Yusif the elder landed it. It was a 13 lb. *Chorinnaeus lysas*. I took plenty of pictures and finally decided

to save the head as a specimen, since the crew cast sort of hungry looks, and it would require a barrel to pickle it. There is a confusion of 2 species in Bleqvad, based on the head. The rear dorsal and anal fins grade into finlets with slight connections between all so that what is fin & finlet is highly debatable. The anal opening is rather in advance in this species, so that the body cavity and testes extend nearly 3 inches behind the anal opening, also there was a rather large semi-transparent air bladder. There were one or two copepod parasites like the ones in Scomberoides. We arrived at the fish pier about 11:00 A.M., and we almost plowed into a barge. That calm prevailed with accompanying heat. Temperature at noon on bare wood deck in sun  $45^{\circ}\text{C}$ . At one o'clock, there sprung up an east wind. at  $3:45^{\circ}\text{P.M.}$  Jim returned from the clinic and getting his wrist strapped, and we left the fish pier, and found an east wind with small white caps. We passed some (2) large terns on a floating 2 by 4 with large black caps with rear tufts and a brown back and yellow bill and other parts white. We saw 4 grey bay porpoises play along side for awhile and then they fell back jumping out of the water (two of them) close together, possibly just playing or a mating act. We arrived at Tarin at the south corner of Tarut Id. around 4:30 P.M. We went ashore with Jumah, capt. of the Tarut, to see Tarin and see the fish market. The only fish we saw were S. siamensis "sawfi arabi" on a couple of strings. Nevertheless we visited Jumah's house which was built of the typical coral rock with shells in evidence all over the pieces of rock. We had arab tea, mida, and coffee with pineapple & grapes thrown in. Later even, a customs officer had to talk with Jim, so we did not get back until after sunset. Tarin is an old pearling town and the old sheiks castle is quite a sight with its rounded turrets at either end

and placed on a high point in the town overlooking the bay. A  boom, numerous jahboots, and one sambuk was on shore with its sharp double ended hull. There were also numerous small "gulps" of several varieties. I never saw such a maze of fish traps as there are in Tarin; there must be close to 50. The streets were very narrow, and the women all wore black skin-tight masks rather than the veil type mask. The children were amused and fascinated by us and followed us thru the streets. There is a piped spring down to the west of town near the sea. It is a six inch pipe with a steady strong flow of water (probably slightly brackish). The town is dry and well above high tide but high water runs part way in each of it where there is almost a field of greenish grass, and then a date orchard beyond.

This evening, I fished over the side with the night, or rather just watched. I saw one small Pegasus, but large silversides were the most numerous. There were only a few herring and half beaks. The bottom was much sand with considerable growth of grass. The evening and most of the night was flat calm.

May 30 - There was one Apogon and 20 or 30 Terapon in the ed pots this morning. It was windy just before dawn this morning and moderate easterly winds thereafter. I wrapped fish and wrote notes for about an hour & half before breakfast. We left Tarin at 7:30 on the Tarut bound for Al Khobar. The wind was light from the ~~south east~~<sup>south east</sup>, and sky clear. We arrived at Al Khobar about 10:30 A.M. Mr. De La Mar showed me a broad sawfish sword which measured 23 inches indicating at least a 6 or 8 foot sawfish which was caught off Al Khobar pier. According to Bleqvad, it appears to be Pristis zijsron.

I wrote letters most of the afternoon, and waited for Gurley, but apparently he had or did not return from Ras Tanura. The temperature in the sand at 5:25 P.M. outside the veranda was  $45^{\circ}\text{C}$ . It still felt

like a furnace. Because we are called back to Bahrain a day at least or possibly 2 days will be completely wasted. My first article came out in the "Sun & Flare" tonight; it was more or less an introduction as to how I happened to be doing what I am doing.

May 31 - Durley is still undecided about staying on, but it looks as tho he will continue on a temporary contract. We had a meeting this morning with Durley, Stewart, and "Swede" H. E. Morrell, the new fisherman from IBI. He is over 6 feet and seems very nice with a long standing yen for fishing. He has fished on the California coast. I think he will make a good and desirable ship mate.

My report was turned in without revamping; its briefness being its only virtue. The rest of the morning was wasted because I could not get a truck to off load all the fishing party equipment off the Tarat, a job I do not relish. Jim was kind enough to see what he could do about getting me cleared for a possible trip to Bahrain. The ground temperature outside at 12:15 today was 50°c and the air temperature 42°c, in other words "wadgit" (it is found) hot. I also wrote a letter to Dr. Bleghval, with a written copy for Dr. Schultz. The truck and car situation is a lot worse than a few months or rather a month ago; so I was unable to get a truck to off load the fishing party equipment. I even went down to Al Khobar but could find nothing there. But I spoke to the crew and rescued some cigarettes for Jim. When Durley got back from Ras Tanura he said formalin had leaked down in the bilge; so it was agreed that the best thing was for me to return to Ras Tanura. On the way, we saw a jackal (about the size and build of a small coyote) cross the road around Qatif. The strong south east swells had rocked the boat considerably, and the big bung was not tight so formalin had leaked a little out of there. Abdullah and I moved the boat once during the night because it pounding against the pier.

## Terns

Gulf weed gone

67

June 1 - Light east winds at dawn. After trying to phone Jim at Bahrain and see Mr. Brown (both unaccomplished missions), I decided to troll around east pier. We left the fish pier at 9:15 A.M. and threw over the red & white & orange & white jigs. The wind was light from the east, sky cloudless. Tarat Id. visible, but Jebel Bahrain and distant shores very hazy almost invisible. White terns abundant on Ras Tanura point. There are greyish terns like the white ones only they appear dirty underneath. Possibly it is caused by oil from tankers. There were 3 freighters (French & English) tied to east pier, and six at anchor. At 11AM at buoy 7 we caught one barracuda on the orange & white jig. The wind was very light from the east. (When going thru the town of Al Khobar yesterday I noticed almost no flies a complete reverse of the situation in March. I had been given to understand that there were more in hot weather. Even at west pier the flies do not seem to be as bad as they were a month or so ago. About 11:30 A.M. a light northwest shamal came up. We got back at 12:15. I talked with Mr. Brown about arrangements for cleaning the boat which was more or less up to us, but with a short handed crew I decided to let it go. At 2 P.M. I lifted my 3 eel pots which were set just south of the new fish pier about the end of the submerged drain pipe at 1½ fath. to 2. There were 2 moderate sized *E. tetrazona* (1 each in the cloth funnel eel pots) also 1 *Plesiops*, 5 wrasse, and 2 *Lethrinus nebulosus*. The tide was high about 1 P.M. About 2:00 P.M. we headed for Zaal Id. where I hope to catch 2 low tides. At 2:40 P.M. we caught a small barracuda with near ripe ovaries. We arrived at Zaal shortly before 3 P.M. Shamal winds are increasing slightly. At 4:20 P.M. most of the distant land was blotted or blurred with dust, and strong shamal winds were blowing. I set my three eel pots off the S.W. corner of Zaal on hard sand & weed bottom. All the long rooted gulf weed had disappeared only small stems and roots were left; apparently

the bloom has faded and gone by. The water ebbing out of the bay was almost hot, and it was very mushy, and I found no suitable place where I could use poison. "Sweede" Gorill arrived on the Tarut near sundown, and they had caught one small charad on their way up from Al Khobar. That evening we fished over the side with a light and a new addition was one charos (*Dorosoma*). The triacanthids were also present, large and small halfbeaks, large & small atherinids, and small dascylliids. About 12 P.M. we finished baiting and setting a 20 hook set line with 2 anchors and using needlefish & halfbeak for bait. It was calm when we set the lines, but the wind came up again before dawn, and increased to strong shamal by the following noon.

June 2 - We got up shortly after dawn this morning, and I did some poisoning in the same coral rock area as before S.W. of Za'al. Because the tide was still ebbing the current dispersed the poison too fast, and only a few small fish were recovered scattered over a surprisingly wide area. The tide was actually abt around 7-8 A.M. When we found our set line we recovered 1 shark <sup>chilosomus</sup>, 3 hooks and one anchor; the line had been cut probably by another shark. If we had used  $\frac{1}{4}$  inch rope, as Ed suggested at one time, it probably would have been alright. Also if there were 2 instead of one buoy. But that time of night, we were not open to the best ideas. In the eel pots, I caught my first gerrid (caught by an eel pot), also a small *L. miniatus*, *Plesios*, and several blennies. <sup>Petrosomus punctatus</sup> We grappled some and dived for the other anchor but the strong tide and wind was prohibitive. The boys speared a small sea turtle but because of the origin of its capture I deemed it wise not to keep it, namely the fish trap which I told

them to keep out of. A small boat with 4 men operating fish pots came by this morning and from 11 pots they had nearly 50 lbs, or a bushel of "sandji arabi" (*Siganus sutorius*) and a few small groupers, jowies, etc. But the bulk was *S. sutorius*, 6-8". Fishing boats were numerous around the bay this morning.

The shamal was light in the morning increasing to heavy by noon with white caps on the bay and with gusts.

Yesterday afternoon, I about lost an eel pot, the boat, and almost broke an oar (it broke the next day), by going down to the "sand" Id. which is on the south side of the channel about  $\frac{1}{4} \text{ to } \frac{1}{2}$  mile south of Za'al Id. The tide was unbelievably swift and treacherous near the Id. and the water at least 3 fathoms right up to the edge were branch coral and other hard looking stuff home into sight. I decided that it was best not to land under these conditions. My eel pot almost disappeared in the current, and I had a hard time making it back to the boat.

At the wind is stronger this afternoon, the horizon is clearer than last evening. "Sweede" left on the "Tarut" to get fixed up in town with his stuff. We headed back for R.T. about 1:45 P.M. with him out behind. I spoke with Stewart over the phone and expect

he will be up Friday night, and I telephoned our order to Tex Evans, and by that time "Sweede" returned. Hamed relieved Youssef at engineer today; so I trust we will have a change for the better. Getting the boat cleaned & caulked and the crew's rations are still current problems.

At 5 P.M. we returned to Za'al from West Pier. The shamal was still strong with dust on the distant horizon and scattered cirrus clouds. We saw a small <sup>10</sup> ft. albacore jump clear out of water near the boat. It seemed to be an albacore because its pectoral appeared to be very long. Terns were diving at it. There

were also other gibbs in the distance all about 2 mi. north of west pier. There were also at least 20 or 30 *P. phaeocena* (grey helmet type) playing around just before we saw the albacore.

Around noon I saw 2 large black and white birds like oyster catchers flying north near Za'al Id. We reached Za'al about 2 P.M. and around sunset the wind flattened out to almost a flat calm. When the tide started to come in white stingy from floated by probably stuff off the flats. We used the light over the side, and caught many 4" halfbeaks and a couple of young *Chilonodon*; "Swede" caught an 18" snake with a dark black head. There was a 3" *Periophthalmodon* inside the snake in recognizable shape and color. We made the mistake of cutting up the snake for bait for a set line; it was absolutely worthless. We also used some halfbeak for bait. We saw some *Trematodus* again. We got the set line set with anchor and cement block by midnight. ~~at 6:30 am~~ The wind came up some during the night and blew quite hard for awhile. There was a beautiful sunset this evening with red clouds.

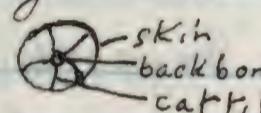

June 3rd - Fair with a light shamal at 6:30 A.M. We caught one Hayash 9 65 cm. 1½ lbs. with egg yolks inside and empty stomach. The crew does not eat them, but will eat "hand". My eel pots yielded only *L. miniatus* + egg fisher + *Plesios* (Brown). They were set in 1 fath, on much sand bottom with grass grass. We did not have time to gravel for yesterdays line and grappled so we left a line and marker. We got under way at 9:05 A.M. I took a picture of the fish traps with Za'al in the background. Tide just about dead low. We put on supplies about 10 A.M.; the ice had been waiting an hour. We got a glimpse of Gurley and arrangements are being made to get the boat cleaned; though it may be part of a ruse the captain went to Bahrain this afternoon to get fish oil for the boat. "Swede" went into Ras Tanura to round up some equipment for fishing gear, and in the afternoon got some floats together.

I spent sometime on the shore to speak more at length with Gurley. I also spent sometime looking up Mr. Brown to discuss the boat situation. Being "cooly pay day" there are no helpers around this afternoon so I decided to head out again for Za'al Id. About 3 p.m. we left the fish pier with <sup>moderate</sup> light shamal wind. It was blowing hardest around noon today. We arrived at Za'al Id. at 4 P.M. and the temperature in the shade was 36°c. In the sun on the museum boxes on deck, it was 42°c. We trolled 2 lines but had no luck. I set my eel pots in the heavy tide off the rocks on the west end of Za'al.

I baited a set line with pieces of "Hayash" the I we got this morning. The tan skin was as rough and tough as the hardest grade emory paper. I found to my surprise 2 slate like egg cases with embryos eggs inside 2½ by 1½"  is evidently this is a small egg laying species. Another egg apparently became free or was free from a case; it was one I noticed in the morning. As the shark had been lying around all day the eggs were odorless and in good preservation and were saved as U-48-85. It was almost a calm when I set the eel pots, and also when Abdullah (Bahan) and I set the set line just before sunset.

After supper from about 9 to 11 P.M., 4 of us went ashore with spears and lanterns to Za'al Id. Except where the fish traps is and the bottom is mud; at low tide the bottom is hard all the way around the island with small pieces of sand rock ("hara"). Walking is difficult, and swimming not advisable except at high tide. I speared a 6" toadfish and saw *sillago*, gut gobs in abundance, and the smaller dark brown crabs. On the north side of the island there were a lot of large fish jingling around when they saw the light. They were silver and 10-12". I think they were mullet, because I saw one, but I am not sure. Hamed caught a 12 inch sole with a yellow lining around his dorsal + anal fins. It was quite chunky, and ex-

tremely slimy when alive. It just literally dripped slime in a way, I have never seen before. Also we caught several small porgies and gerrids which were blinded by the light and were easy to pick up. Hamed caught two baby terns which I also kept. The night was clear and rather humid with wet decks and little wind.

June 4th - Clear at dawn with light shamal winds. I could not see the set line buoys so we are waiting for ebb slack. About 9:40 A.M. the boys recovered the set line when the tide slacked. There were no fish, yet only shark skin was left, the meat was all eaten out from the skin . Most hooks were cleaned. It would seem that "Bogach" makes indifferent to poor bait. At 10 A.M. the Trant arrived with 2 books for Jim from New York. It is very clear and hot with almost a flat calm. 32°C in the shade. 49°C in sun on wood museum box on deck. Water temp. 30°C off Za'al at 11 A.M., and 29°C off the boat. About 1:30 P.M., we left Za'al and trolled 2 lines. There was a breeze from the east. I decided to return to Ras Tanura tonight, because Abdulla, captain, is supposed to return with paint etc. from Kanoos. This morning I saw at least 8 fishing boats fishing for pots (geringer),  about 16 ft. long and with 4 crew. One with a long staff with a spear, 2 rowing, and one usually overboard ready to dive to place the pots. They use sail to get to the grounds. Quite a few fish off the long bank west of Za'al Id. We continued out beyond east pier to buoy 7; Shahrain and Jebel Shahrain were visible in the distance. We saw one large school of "jibab" about 3 mi. N.E. of east pier. They seemed to be 18 to 24 inches in length, and <sup>temp</sup> ~~golds~~ were diving on top, a couple of smaller schools were passed later. The sky was cloudless. I also saw several long fin  black porpoises. The Palestine barely index along these days. Birds seem to be tamer here but it may be just the heat, because yesterday afternoon

I rowed past 2 cormorants on the rocky west Pt. of Za'al Id. One finally flopped into the water and swam lazily off. The other just sat for a long time; it must have passed easily within 50 feet of them. Then also the crew are always catching terns and birds with their hands both day and night; may be it is just because it is Arabia.

I lost one of my arab sandals overboard returning from buoy 7, which is akin to stark tragedy; I had grown very attached to them.

 We reached the fish pier about 7 P.M. with not even a strike on the old raw jig and plastic feather. I went into Ras Tanura this evening to mail a letter to Schiele, get a change from the pier, eat, and see the movies which are a relaxation because of contrast over here. It was hot and a flat calm all night. Abdulla returned last night with a letter from Kanoos.

June 5th - Up at 6:30 A.M. In the shade it is 36°C. It is boiling hot at 7 A.M. Nice cool of the morning. "Swede" arrived shortly after 7. Flat calm. About 8:00 a light wind came up but that soon died down. I spent an hour or so trying to get Durley or Stewart on the phone, but no luck. Because the crew was starting to clean the boat, and were going to beach it tomorrow morning, I went to Shahrain to straighten up my room; so I could leave bag and baggage at a moments notice. I mailed a letter for "Swede" and mailed 2 films air mail to Schultz in the States, 8 $\frac{1}{2}$  reals. I had a good ride to Shahrain with a good car and driver. When I reached Shahrain I could not find Stewart, and Ed I assumed had gone to Ras Tanura. I wrapped up my specimens which I collected the first month at Shahrain, and prepared them to take back with me to Ras Tanura. It was clear, hot, and cloudless today. I saw Ed about 7 P.M. and handed him Kanoos letter re: the "Palestine", and I returned to Ras Tanura on the

8 P.M. bus. It was glass calm all night, and quite hot.

June 6<sup>th</sup> - There was a light east wind shortly after dawn; then at 7:10 a sudden gust of dust ushered in the shamal, which soon leveled out to a steady breeze. Sky clear & cloudless. The crew ran the boat up on the south side of west pier, just as the tide started to lower. They did a good job cleaning the bottom of the boat during the low tide. "Swee" went out with the Tarat about 7:30 A.M. and returned at <sup>11 A.M.</sup> ~~noon~~ trolling. The shamal was quite rough and they didn't even get strikes. I took a can of fish into Ras Tanura storehouse where they are loading in rails at a great rate. My boxes will probably soon be covered up. #5 box & tank were brought + #67 tank which was interchanged with other 8 gal. tank of fish. About 11:30 A.M. Darley appeared and we looked over the progress of the fish plant which he now expects will be ready by June 15<sup>th</sup>. We all 3 ate lunch at Ras Tanura, and looked for Mr. Evans in the p.m.; we finally found him, and found out about the removal of the Emir's party Arab food from the Tarat. I ordered 6 15"-35" galvanized drums for fish specimens. Steel drums rust too quickly. Ahmed lifted my eel pots yesterday, but there was nothing, but when I lifted them there were 2 <sup>balūl</sup> Hamer (1-9½") in an eel pot which got wrapped around the pipe line, a red Mullus and a Plotosus anguillaris in another, maf in the 3rd one. We went to "Had al Louh" for the night with both boats. The shamal lightened slightly nearing sunset. The front glass well got smashed today; so it was repaired by Arab carpenters with ply wood in a passable fashion. After supper, the 2 Abdullahs & Yusif Suede and I went ashore and reined with the 100 ft seine. The 2 Abdullahs would bunch up the net and get out away parallel to shore then they would walk quickly away from each other and straight inshore it worked well. They caught over a half beg or 15 lbs. of fish consisting of 2 <sup>species</sup> Gerrids (1 10" S.L.)

several S. sigrams, red Mullus, common Mullus, Chelon, Terapon, blunt nose porgies, porgies (silver), 1 sole, atherinids (large), Sillago, scorpacids small, spot herring; it was hard to say which was most abundant. Suede and I tried later but we didn't do so well covering the same ground. Chanos (with sea bream head) & Apocon thorstoni were also caught, & Lethrinus miniatus & shrimp.

June 7<sup>th</sup> - All night and early morning the shamal was very strong and gusty. I set the eel pots overboard last night, and got about 40 Terapots in the one with a wire funnel, and one or two in the others. The only bait in the wire pot were live hermit crabs. There were also several small Apocon thorstoni, and one Pacapercis 3 fath. of water and much sand bottom. A 25 hook set line baited with fresh bait last night and set near the eel pots yielded nothing and we lost one hook. Crabs and small fish probably ate the bait off. We got started about 7:45 A.M. bound back for west pier. Weather cloudless sky strong shamal, but less gusty than last night. At West Pier, I tried telephoning Darley with no success, but managed to get an order in for water (its like pulling teeth only worse). "Swee" did extensive carpentry on the boat making shelves for Ahmed; also the lines and nets were set out to dry. The Fish pier is an ideal place now to dry nets. We spent most of the afternoon trying to get water, the same old story, delay and more delay; finally we got it about 5:30 P.M. The truck never did come to take off the party rations; they probably drove around west pier and never looked farther. We have rather incoherent orders to proceed to al Khobar and wait. We will go tomorrow, if weather permits. The shamal toned down slightly in the afternoon. We proceeded about 1¼ miles north of west pier to a sandy spot. We saw a large turtle at least with a 3 foot shell off the fish pier again. By 7:20 P.M. the shamal had died down to a very light breeze. <sup>as. 1st</sup> On Ratima, sand hummock near road. After supper we went ashore again to seine with

wadit turns here ↗

the crew. Except for one good haul, the other four or five were poor. We got about 3/4 of a basket of *S. siganus*, tut; anvs with the spot, porgies silver, fashas, sillago, chelon, Chanos, shrimps, trout nose porgies, several flatfish, silversides, terapon, goatfish (2 species), gerrids (1 species), scorpaenid (fargaleh), 2 of the rarer apogonids. Swede stepped on a small scorpaenid ( $\frac{1}{2}$ ") and got a stinging pain in his toe and foot which finally spread to his groin, and bothered him for over a half hour. I watched one wiggle itself down into the wet sand with its front dorsal spines erect, and its pectorals spread to give itself steadiness. Abdullah caught the rascal, and they were all sure it was the fargaleh, and the crew handle them with respect according to them they do not exceed 8 inches in length. We had a flat calm to seine in, and the spot started shaggers were the most abundant fish. Swede said it felt something like a bee sting.

When we got back to the boat we saw several shark sucker swimming around. Spearing failed, but Hamed and Youssef tossed over fish lines near the light, and bang tang 2 were landed on deck. One was a good 2 feet the other about 20 inches, V-48-89; they looked like typical *Echeneis naucrates* with the black stripe on the side, but they did not have the white tipped tail of the Long Island species. The shamal came up during the night sometime, and was blowing hard from 2 A.M. on, and the boat was pitching back and forth.

June 8 - Clear at sunrise with strong shamal winds. The set line was minus 3 hooks, and the 4th was straightened out; probably a large snake. The crabs were thicker than sin last night and we were about 100 yds. from shore. The snakes were also thick. The bait consisted of some anchovy. We got under way at 7:30 A.M. bound for west pier. At 8:25 A.M. We left west pier for Al Khobar at the Palestine. We reached Al Khobar at 12:45 P.M. The shamal increased considerably about noon, and all

173

Khobar was a haze of dust, and hot winds. There is a long shallow bar with grass on it opposite Dammam. At the south end of it near a buoy I saw a genuine osprey. This afternoon, we went ashore and met Gurley who came down to see us, and we got Ahmed straightened out on pay & letters, and got in a food order. stopped in to see Jim, and he said he might be over to Bahrain in a day or so. We left Khobar pier at 5:45 arriving at "Al Baini" at 6:50 going almost due east. There was quite a shamal at Shahrain & Al Khobar with the dust blowing over the road. By 5:00 pm. the shamal had abated slightly. About  $\frac{1}{2}$  way to Al Baini we passed a solid band of pulsating jellyfish (the solid white large ones). They looked like a strip of solid ice chunks in the water. They were north and south as far as the eye could see and the band was about 30ft. or 40 ft. thick and as deep as you could see. Elsewhere they were abundant. It

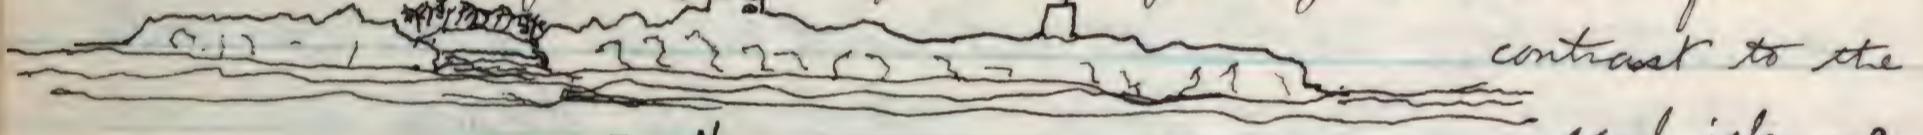

"Al Baini"

N anchor by. It was inhabited by terns and cormorants. I am glad that the crew brought us out here. The hills of Shahrain could be seen dimly under the setting sun, and the outlying isles of Bahrain could be seen to the east. The shamal continued all evening & night. Even so we set a set line & 3 eel pots, and seined on the isle. I also caught some pipefish & gg. Siganids with the light over side. Just a few attenids and small porgies & mullet were caught on the lee side of the isle. Cymindidae dispia were present on the windward side. There was sand and considerable current all around. There were lots of large ghost crabs on the beach all around the isle. And the cormorants did not move much when I walked near them.

June 9th - Swede and I were up at dawn this morning to lift

the pots & set line. Except for hermit crabs, it was a blank. Only a little bait was eaten off. There was dust on the horizon. Svede left with the "gulf" and gear on the "Rumt" about 7:20 bound for Al Khobar & Ras Tanura. The wind was nearly calm at dawn, but started to pick up by 7:30 A.M.; I also sent a letter off to Jufile via Svede. I shaved with Ahmed's razor and we set sail for Bahrain at 8:10 A.M. leaving Al Baine ~~sawm~~. Svede said he saw a flying fish yesterday. Light shamal winds with haze all around, probably dust.

Naaiyat shallow area off port bow with 2 fish traps 9:05 A.M., course S.E. At 9:15 A.M. we passed near Tidda a strange rock isle may be 100 ft. high with a jail there. I took 2 pictures. It was about 1/4 mile long, and the oil pipe line goes by it. It is quite a

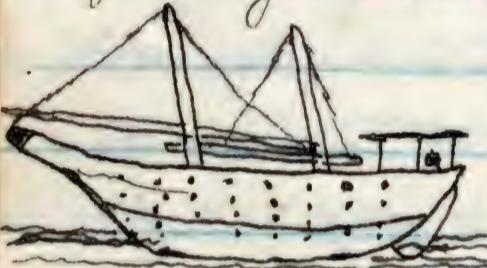

contrast to the sand isle we had just come from. At 9:30 going due east we hit "Um Sabon", a long low island with palm trees and one nice looking cement building. We went around "Um Sabon" and the water was very clear about 2 fathoms in depth. Some sand rock on the shores. No good collecting places apparent, no coral visible. The north end has the house & date garden. At 9:45 A.M. the shamal winds picked up to a moderate breeze. The coast of Bahrain is about 1 mile east of "Um Sabon". The stake fish traps appear smaller and a different shape than those in Saudi-Arabia. 10:05 continuing north along west coast of Bahrain. White jellyfish abundant in the water. A shallow sandy area Dali is to our port with fish traps 10:10 El Nakayat a rock channel marker? to our starboard; course N by E 10:15 A.M. shamal stiffening to small white caps. About 3 miles offshore and Bahrain is hazy. Air temp. 35°C in shade with breeze blowing. It feels comfortable. 10:45 A.M. "Luthor" channel marker cement. 11:05 A.M. bearing due east along Bahrain coast numerous date gardens. This at al ay "11:15 high spot on shore with ruins?" "Had al Ley" shallow

area to port. We arrived at Manama pier at noon. There is no dust in the air here. Hamed took me to the aranco building, and after long waiting Mr. Braddich appeared long enough so that I could give him my passport, and he got quarters for me at Babco ~~at~~ Owali. I do not think I will go there now, but may be later. I will stay on board tonight. The shamal continued moderate to sundown when it became very light. It was an interesting spectacle to see at least 200 or more boats and jalboats in the Manama harbor. and to hear the musical rhythmic chants of sailors rowing their long boats to and fro from their master ships to shore. As Hamed and I walked down Manama pier we saw baskets of several hundred pounds of dried fish supposedly from Persia They were split right amid ships with each side laid open. The meat was dull brown but without flies. Most common were ginn (foot) *Scarus dussumieri* 12-14". Next were shair *Lethrinus*, then *E. favina*, and *E.* (black with white spots, then black labrids *Cheirodon*? 8"-10". Also were several type of skin jacks . Then I rested for awhile and later Hamed and I went to the fish market where dried and fresh fish were present. For the first time I saw *Scomberosomus guttatus* with the dots on the side (though 2 species are recognized apparently the same name is used. All specimens were split and dried and some were said to have come from Jabil. Both species were present for comparison; gill rakers could not be counted. *Siganus punctatus* was <sup>jaws</sup> <sup>2nd</sup> very abundant, whereas *S. sutorius* were fewer. 1 bushel of dried anchovy were called "oom", several dried mullet, and a large 3 ft. dried charad. There were some small porgies and snappers, and dried gerrids, but otherwise nothing of special notice. Some of the oars are fancy here round pieces of metal on a pole painted white with blue borders. The largest crew consisted of 8 men rowing in unison. I wish I had taken a picture of one in particular. Children and men run

(2) crews consisted of 8 men rowing in unison. Children and men run

around throwing bits of dried fish, as though it were candy. And they apparently enjoy it. Mr. Kanoo, Jr. whom I met with Burley in April came out on the pier to say hello; and later in the afternoon Mr. Kanoo, Sr. came with his sons on board to say hello and pay a visit; we had a pleasant conversation, and he invited me to stop by in the morning. It also may be able to borrow a "gulz" for a trip to Fasht al Tarim. I am also contemplating a bicycle trip around the island. I bought a pair of sandals (naal) for 7 rupees, and #10 ramekins for Swede & rame.

This illustration gives an idea of the boats with their large foremast, odd phallic bow sprit, high sides and straight sharp angled hull. They are about 60 to 80 feet in length. I went to bed early tonight because I couldn't keep awake writing a letter.

June 10<sup>th</sup> - I was lazy this morning and lay in bed till 6:30 A.M. By that time the carpenter had been working at least a half hour. Saws were going and hammers ringing on the other boats near by. But I really had one of my most comfortable nights sleep on this old waterfront, because there was a fair breeze off the water most of the night. Altho I have an audience for meals stay that quietly and come and go. It was 31°C at 7:30 A.M. on the "Palestine" at the waterfront.

I went to visit Mr. Kanoo, and the Emir's uncle also came in, and we talked a bit about fish. Mr. Kanoo had a contractor (for fish) come but it was too late for many fish. However, there was the same dried fish, and a few fresh small jorgies with the usual cloud of flies. This afternoon at 3 p.m. I went again to the market, and there was a fresh 16" Lotjanus with rich red fins and pinkish silver body (it was not of course well enough preserved for a specimen, and ran about 3 lbs.) There were a number of *Tethraimus nebulosus* possibly 3 lbs in wt. All the *Tethraimus* miniatu were very small 4-5". A bushel

*S. sanguineus* was present in place of the *S. punctatus* of yesterday. Small fashas, and other jorgies were present. Some of the dried fish if not all of them were the same ones as yesterday. The fresh fish apparently sell faster. I walked along the water front and saw ships carpenters laying new keels from rough hewn tree trunks. In fact one man was sawing lengthwise thru a log to make a prow. A good deal of alva is in the shallows along the water front with *Cyprinodon* digers numerous in it. I saw 2 natives with alva in basket. I also saw men and boys carrying sea rock on their heads to the street from the boat. I went to see Mr. Kanoo at 3:30 but he was not yet in; so I went to Aramco house to call Mr. Chubb, 165 J, Qadisi. He was not in, but I found out that Jim had come over today, and was at the B.O.A.C. house; so I stopped in to see him and we talked until near sun down, and then I went back to the boat to eat, and brought some last minute things, such as wood shoes and paragoric, back to Jim. As I was surprised to see English sparrows at Dariin, Tarut Is., I was also surprised to see them at Bahrain & Shahan. The weather was humid hot and calm today. I wrote a letter to Suile this evening.

June 11<sup>th</sup> - The carpenter arrived at 6:00 A.M. today. There was a light breeze from N.W. but ~~the~~ decks were wet whereas they were dry the night before. It is now 6:30 A.M. and the sun is very hot already. Between 6:30 & 7:00 I saw a few small reddish cumulus clouds on the west horizon. A moderate shamal came up starting about 7:30 A.M. from 8:00 - 9:00 A.M. I rented a bicycle and went across the bridge to Maharah, because Abdullah said a fisherman was coming for me when the tide was out so I came back early. I visited the Manama market and there was nothing but small *Tethraimus* barbuda etc. about a bushel in all at 7:45. There is a channel

under the bridge near the toll gate at Maharah. The baiti 4 to 6 lbs or more each were very abundant here during the outgoing tide. A boy was fishing with a 4° hook and thin wire leader and light line. He had some small barracuda and leatherjacks for bait. He would charm the baiti with pieces of fish and then throw in the hook. He had one in a basket, and I saw him hook and land another. Most of the time, however, the baiti were very shy of the bait on the hooks. I also saw Liparindon dispar in great abundance in the shallows along the bridge. I also observed small atherinids on the other side. The bottom along the bridge was hard to make out some weed, sand & scattered rocks. I saw also a large school of large atherinids between our boat and the banana pier. Maharah is due east of Panama.

Hasane Burmoys, a fisherman friend of Abdulla, captain, arrived about 10:30 A.M. in his 16 foot boat to take me out when the tide was right. We went over some of the fishes in Belgrad, and he gave me the names of some. We left about 11:30 A.M. in his long boat, and he speared a 14 lbs. sting ray, U-48-73, and took me all over the bay between Panama and Maharah. It was just about a flat calm with a boiling sun. At 7:30 A.M. it was 38° C. The bottom was mostly sand & "hashish" (alva) also some bare spots, some rather large coral rock formations which were roundish with a few small brain corals. Then there was some grass and much sand area near shore. The rock areas were called "fashl." There was also that much sand bottom with soft weed and those large sea anemones, "mugorish"? His pots were flat on the bottom and round with sort of a flattened  round shape above two funnels, and an opening door. They were about 2 feet high by 3' in diameter. Most of them were in a fathom of water. We looked at 5: #1 1 grouper 1 Plectrogenus, 1 + oadfish; all that was in the traps. The traps are

baited with alva and mad beat up into a mash with a flat stone. Before we speared on stingray we saw another one swimming away from the boat. #2 trap had grouper, button, batul, and S. sigmoides about 5 lbs. of fish in all. #3 no fish. #4, 3 Scylopus not lifted, #5 near the "fashl" had one Chilonodon. Around the "fashl" we saw Plesiops and black pomacentrids, and one mayasah. Then we started to see several freshly dead fish on the bottom mostly 4" inch Lettrinus nebulosus, one or two Sargus noct, and a couple of quenqufan. A certain dark brown algae growing on the rocks is known as "gusordi"? This poison comes in a dried berry form and is mixed with "oom" into a mash, and fed to the fish. It comes from "Calicut" and is known as "sim". Abdulla brought me about 4 lbs. of it for 3 rupees the next day, and I saved some for specimens to try and determine the species of plant used. Apparently it is very effective. It continued calm all day and evening. Hasane did quite a bit of diving to get the traps, and also pick up dead fish. Also he got a sea urchin "slity" for me, the short spined form. I saw some tiny flying fish on the surface in 6 feet of water about 1 mile offshore from the channel under the bridge near the Maharah toll gate. I saw a couple and finally caught two 15-20mm. in length. We returned pretty well seen back about 3 P.M. About 4:30, Mr. Habib Kenoo came in his Lincoln to take me to one of his date gardens to show me around besides dates he has grapes, papayas, mangoes (starting), tamarinds, mulberries, citrons, oranges, pomegranates; vegetables such as melons, onions, mint, cucumbers, etc. They are irrigated by artesian wells. He also took me to a little stone house by the sea, from the roof of which we could see the sand beach, the calm bay, and the palm sthe fish traps. We saw 7 fishermen come in with one boat and fish traps and they had a scarce ½ bushel

of L. digatus and some L. nebulosus, not much of a catch. The "sawfee" L. digatus is considered very good eating. The fish traps here have a leader, hearts, and trap rather than the V shaped traps over in Tarut Bay. I believe this type in Bahrain is more efficient in that it probably catches more fish which are moving parallel to the shore.

Cyprinodon digbyi were very abundant along the sand beach, and also in the drainage ditches and wells of the date garden. In an interior well with cement around it there was considerable growth of ~~shallow~~ dark filamentous blue green algae. The water was quite cool. I saw several frogs in all. Ticks are more abundant here in Bahrain than at Saudi right now. This late afternoon & evening was pleasant. Also the beach here was covered with cuttle bones. This garden was about ½ way between Manama & Owali. I fished a little over the side tonight, and caught only small athinids, and speared a cuttlefish with a pole the tide was quite high. Almonds were also present in the date garden but not yet ripe, also there was a type of bean trees where only the pulp around the seed is eaten the seed is black, the pulp white and the bean green. It recalls to mind a similar tree bean in Puerto Rico.

June 12 - a hazy sky at dawn and the deck was not wet from dew at 6:00 A.M., about 7 A.M. a moderate shamal sprang up and blew making it comfortable on the boat at  $37^{\circ}\text{E}$  at 9 A.M. in the shade. After writing notes, I decided to take a trip out to Owali to meet Mr. Russell Brown to whom my letter was addressed. I met both Mr. Brown and Mr. Crow, manager and ass. manager; and then Mr. Henry Chub was called in, whom I wanted especially to meet. Henry then took me to his office in the sanitation dept. and we swapped notes

until nearly lunch time. The food served at Babco seems very good. The dining room is cleaner, the waiters better, and everything else compared even with Ras Tanura. Henry picked me up again at 1:15 P.M. and we went into Manama to the boat where I picked up some things.

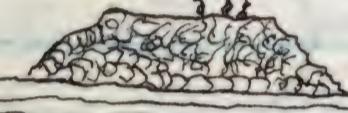

We stopped by at 3:30 at the fish market and saw 4 lb. Lethrinus nebulosus, another chekka, and fresh rabbit, and at last I lay my eyes on the famous gaffdar which turned out to be a large caranx with a Seriola like mouth and prominent black dots on the sides.

(approx.)  
from  
memory  
(see p. 95)

The specimens were about 6 or 8 in number, and all around 30" s. l. and

were fairly fresh looking. Then we went on towards Owali, and stopped at a salt marsh just between the date gardens and the desert by a bridge. The marsh extended towards the Gulf on either side east and west. The temperature of the air was about  $39^{\circ}\text{C}$ , and the warmest mud pools a scarce  $40^{\circ}\text{C}$ . There were clumps of tiny mangrove with small yellow flowers, and very small sprouts sticking out of the mud. The leaves were rounded shiny and satiny smooth surface. The desert between Owali and Manama has many hummocks with small patches of weeds in places and one large hill and several smaller ones. It gives the appearance of great expanse with none of the movable sand dunes. I received very nice hospitality at the Chubb household from Mr. & Mrs. and we went to the movies in the evening.

June 13 - Clear with continued moderate shamal winds, but clearer sky. This morning, I went into town in Chubbs truck, and got my passport, and visited the fish market again. There was the same old stuff plus one 2 foot catfish (Arius), and a bushel of small 3 inch. goatfish with the yellow stripe down the side known as "bauassay". Small 3 inch barracuda were "italie". One fellow had some

were begone pieces or fillets of salt mackerel, which by the heavy stripes looked most like Euthynus alletteratus the stuff was called "malhay". Also a weird looking dried porpoise was called "burtam". It was stout with big scales and prominent teeth, a black grouper was also called burtam, I guess they just don't tell the dried fish apart. The time was about 10:30 A.M. We got ready to go about 1:30 P.M.; Chubb arrived at 12:30, and took a little more lunch with me. We left at 2:30 p.m. the gulf we left behind because it sank and had no oars. There was a moderate shamal with white caps, and we headed about MNW till 3:55 P.M. we passed abeam  "Seneya jedum" a small rocky islet may be 20 feet high and 120 ft. long with cormorants on top then we changed to due north till 4:30 P.M. then N.E. by E shoal areas with sea weed bottom. At 5:45 we arrived at Fasht al Jarim which is no island but a large shallow area with sand bottom and patches of small mostly dead coral. About 4-6 feet of water at low tide. Henry S. Chubb and I went over board to look around with glass masks. Henry saw a small bayasch under a coral head which looked like an eel. Abdullah dove down and caught it by hand, V-48-97. We also saw Pomacentrus (black), Plesiops nigricans, Scalopsis personata, Scalopsis with the stripes, Lutjanus with the spot, Periophthalmus, Sargus noct, Sparus bifasciatus, green wrasse, and Pomacentrus <sup>maculatus</sup>. The species were few and the fish small and not too plentiful. There were two other fishing boats there, but they had no fish. In spite of a continuous moderate shamal all night we were in fairly calm water because the Fasht to windward of us was shallow, and probably broke the sea. In the evening, I caught some larval fish, most of the bait was serring. I saw 2 snakes, and one shark sucker, and a bill fish. There were also a couple of snakearm smooth starfish which were tan colored.

June 14 - Clear at dawn with increasing strong shamal winds. We got under way at 6 A.M. and reached Manama about 8:30 A.M. A couple of porpoises followed us along the way. The boat rolled quite a bit, and I imagine Henry was glad when we reached port. The stench from the dhows was so great on the west side of Manama pier, that we moved around to the east side and anchored just a little way off the pier. Then a barge came in and we moved out when I lay exhausted below; then without Abdullah captain I made the mistake of letting Yusif & Hamed take us back into the pier. After smashing against the side of one dhow, getting tangled in the line (anchor) of another dhow and scraping our side against a steel barge; they finally decided to move to Muharraq where in time we picked up both Abdullahs. I gave my watch a half hours bath in salt water yesterday, then fresh water, alcohol, benzine, and Abdullah got it fixed for 3½ ryees. I left word with the aramco office that we were still held up in Bahrain. I went for a bicycle ride and broke a chain, then I got another bicycle and went to Muharraq which is flat with a town some date palms and shallow water inlets from the sea. Both on Manama pier and in Muharraq I saw some large wire traps with single funnel and round shaped. They were about 3½ feet high and possibly 3 ft. in diameter on the bottom. May be they were gulf traps. When I got back from the bicycle trip, I drank about a gallon of water in a short time. The shamal blew very strong all day, and into the night. We spent the night rolling with the dhows on the dusty and stinky west side of Manama pier. The Palestine is now taking more water than before, this is just a little good news. The shamal at night blew all the dust off the dock on to our boat including splinters of wood. Sleep was hardly profitable the first half of the night. I tried the table down below, and then right on deck.

June 15 - Continued strong shamal, the moon was clouded with dust early this morning, and visibility is about  $\frac{1}{4}$  mile at most. The flies are a damn nuisance at this pier. The shade temperature is  $35^{\circ}\text{C}$ . The crew found the leak in the boat up in the bow but say they can fix it in Ras Tanura. Now we are waiting for the weather. This morning, I wrapped a collection of fishes and with both Abdallah's help some leaders to small hooks were made. Temperature on top of a kerosene barrel on deck in sun is  $49^{\circ}\text{C}$ . at 11:30 A.M. Water temp. near end of Manama pier  $29^{\circ}\text{C}$  at near high tide. I tried some salt cuttlefish on the small hooks and it looked just like fresh stuff after it had soaked a little water, but there was a lot of alva getting on the hooks, and I got no bites tho I lost some bait.

I went into town around 3:30, but there were only dried fish, a couple of squashed crabs, and fins from a large jackfish. The flies had moved over to feast on a freshly killed goat. The town all over seemed to stink worse than ever today, but may be it is always that way, and only that my spirits are a little lower now. Watching the long boat crews go by all day is a site. One long boat had two black Tom-tom beaters and a hornblower as well as the drumming and chanting. Usually there is one chanter he may be rowing in the middle or sitting astern while the others hum a chorus in unison and time to the oars. The Hawaiians replace the hum with a curious growl as mentioned in the "Sons of Sinbad." The shamal lessened in the afternoon, almost calm by 5 P.M.; I would like to have moved away from the pier, may be to a fishing spot. Of course, there wasn't any enthusiasm from the crew on this point. About 7:45 P.M. at dusk a breeze picked up from the west but it was light. After dark I tried night light fishing over the side not expecting much, but it turned out to be the best yet: small flying fish, pipefish,

young jacks, blowfish, and the crowning achievement 3 sea horses about 1 A.M. I had secretly yearned for sea horses "wuzz" in Arabic meaning turkey.

June 16 - Hard shamal from 1 A.M. on visibility less than  $\frac{1}{4}$  mile at 8 A.M. at which time we set sail. Course N.W. by W. 8:10 A.M. out-most shows only visible; Bahrain out of sight. The boat is the dirtiest with dust, I have seen yet. 10:25 Khor Fasht buoy  $\frac{1}{4}$  mi. off port beam.

A 1 jalboot on our starboard going S.E.; our course N.W. just a hair west of the shamal wind. Horizon still dusty but slightly clearer. Another jalboot off starboard bow at 10:30  $\frac{1}{4}$  mile same course as first jalboot. White caps, gusty wind, waves possibly 2 feet; no detectable swells. We saw a black cormorant about 10 A.M. bringing to mind that most of them are brownish with grey white throats around here. There may be two species or difference in color of the sexes. By 10:50 increasing shamal winds brought almost constant squalls and the waves and small swells may possibly some of them been 4 feet. Some spray came on deck, and the Palestine labored heavily making little headway against the teeth of the wind. 11:40 A.M. course changed to S.W. to follow the trough of the sea and make for land. 12:10 P.M. tug sighted  $\frac{1}{4}$  mi. south at Chas chas anchorage. 12:15 P.M. broad 100 ft. band of numerous jellyfish (large white ones again). 12:40 P.M. Chas chas shoal reached and course changed to N.W. The seas were considerably smaller here, and possibly the wind less. At 1:30 P.M. we heaved anchor to pump the bilge and to refuel. It is nice there are so many shallow places. At 2:30 P.M. the sky was clearer visibility at least a mile, no shore in sight. We are probably in the lower reaches of Tarut Bay. The water is greyish green here like the water at Saibat & Qatif. We weigh anchor at 2:30 P.M. and are off again for Ras Tanura. 4:15 P.M. after sailing all points of the compass we passed Chas chas sand bar which has a tide pond in the center

of it. But without the rowboat, I decided that it was hardly the place to stay. After changing course from N.W. to S.W. once again we passed Naywa buoy or marker 2 miles on our starboard beam at 6 P.M. Visibility better, breeze moderate shamal, course N.W. again. Very light breeze when we arrived at the fish pier at 8 P.M. The decks are already very damp, and we are in for a calm night. Mohamed brought a weeks collection of fish on board. Ed and Mr. Feltman say the plant is already to open tomorrow, in fact it has been ready the two days of the blow. It will be interesting to see what transpires tomorrow. Ed has gotten us a good room 22 B in Ras Tanura which is certainly more accessible. Both Ed and I slept thru the alarm at 3:00 A.M. Mr. Feltman woke us up at 5 A.M.

June 17 - Ed went on out ahead and Swede and I came on out around 6 A.M. No fish boats have appeared yet. I saw some fish under some weed and grabbed them. The rest of the morning, I wrapped fish and wrote up notes. No boats came in this morning. It was calm and clear most of the morning. I also read good letters from home. I finished and mailed a letter to Dr. Schultz & Lucile. And rested the rest of the afternoon with a mild case of the runs. Swede and I will be fishing tonight. It was after 7 P.M. by the time we got 2 company sets straightened out and on board. Then we went up to "Had al Louh" to fish for the night. We caught <sup>each</sup> 1 of two species of *Scolopsis* in the first haul of an old bag seine. The crew dragged that bag seine over some rough bottom and tore it all up; it would have lasted longer if we had stuck to sand bottom. Finally the crew of the *Tarut* and *Yufif* caught about a half bucket of fish. Gerrids, sillago, *Lutjanus*, flounder, *Platycephalus*, mullet, atherinids, 1 button, goatfish (2 species), herring, etc. The weather was fair with light S.E. winds. We tried a 300 ft. big mesh seine but with only one ear loop we could not operate it very well.

June 18 - Cool at dawn or rather 7 A.M. 31°C. There were actual clouds on the western horizon. Light breeze W by N with a sudden light fog at 7:15 A.M. The crabs were kind enough to take the bait off our seven shark line hooks. At 8:10 A.M. we left for fish pier to dry the nets. I caught quite a number of small *A. marginatus* with the dip net under the end of the fish pier. Then I tried some rotenone along the rocks at the shore end of the pier. The tide was coming in rather strong, though it was low. Even so I got a number of interesting larval fish. The most beautiful fish was a small dark blue and vermilion orange pseudochromid

45 m.m. t.l. Another was also seen in the rocks but was not recovered. A colored pomacentrid 37 m.m. was also recovered; it was blue black above and dull yellow below with black spot on the dorsal, anterior peduncle top, and pectoral top base as indicated in the drawing. I strongly suspect this would become all black as it grew older.

Smaller ones than this are a brighter blue above and lighter yellow below. A shamal sprang up between 12 + 12:30; before that it was almost calm. One tiny grouper was almost a silhouette with white spots, the distribution of which are

reprinted here. I think this is the young of the black grouper or "sbaiti." At any rate it is interesting to find these young groupers also E. *Taurina* around 25 m.m. at this time.

Several days ago Swede saw a 7 foot little hammerhead or bonnet shark north of the fish pier, and he thinks that is what cuts our lines and straightens our hooks. The shamal increased to strong about 4 P.M. with white caps in the bay. It is interesting to me how fast the fishes have collected around the new fish pier. Barnacles have already grown solid on the steel dock pilings. Besides snappers, gerrids, small fishes, I also saw an 8 inch *Plectrolygodes*.

pictus in the rocks at the base of the pier. *Plesiops* and *Pomacentrids* have also flocked around, and even angel fish. <sup>June 19</sup> The shamal was blowing still at 7 P.M. tho somewhat lighter. Svede did not appear so I went to the movies, and it was flat calm when I returned to the boat. The wind came up and flattened out about 3 times during the night. At dawn it was blowing strong WNW and gradually shifted more to N.W. as the morning went on. I netted some blennies from weed floating by at 6 A.M., and kept several in a gallon jar of salt water, but they had all died by 10:30 A.M. I lifted the eel pots this morning and got the usual species but a fair variety a toadfish, *Lethrinus*, both *Arogons*, a filefish, *Pelates*, wrasse, *Plesiops*, and *Pterygopristis*. I spent a good part of the morning finding Mr. Evans to give him the order for our food and supplies. I finally found him in his office and passed over the order. I went into town for lunch today, and after lunch I roved the sand beach on the Gulf. It seemed to be pure sand with sea weed in the waves being brought up by the shamal, and numerous small shells in two main rows half way up the beach, and some at the water's edge. Pearl oysters, several species of clams, a small black oyster, one or two limpets, one very small mussel, snail, worm shells, scallops, and rough red clams  were among the shells found and kept. I also got a letter today from Trotter, with an excellent picture of her and Julie and also Larry and Marion. This afternoon was used up waiting for supplies and everything happened in as exasperating manner as possible. Still no mechanic came for the light motor and the water did not come till 6 P.M. Such a day just wears one out and there is little to show for it. The wind had lightened by sunset. I left the pier in the Palestine about sunset bound  $1\frac{1}{4}$  north. Svede was talking to some folks, and would have followed in the *Tarut*, but her batteries were dead. Not knowing the trouble and

93

our light plant being dead and no galv, we returned at 10 p.m. to find a fisherman claiming he had 1,000 lbs. of fish sold at the customs pier. I was about ready to blow my tops since I love the "shuntas" like I do a bad case of small pox; it turned out, however, their boat had come to pass customs, and the motor did not start again. So we towed it to the fish pier with the Palestine and I had them unload the fish on the pier. Then I went to get Kurney who was just getting up. The only thanks for my pains was to get a bawling out for unloading the fish on the pier which meant the Co. had to buy them. But life is like that here. There was 13.75 lbs. of fish which filleted down to 425 lbs. They were caught with shrimp as bait a crab for chum off Najwa in 2 hours around sun down with 15 men fishing. "Gufdar" or "Gufda" were the most abundant, then parrotfish, several groupers, 2 *Rachycentron*, 1 shari, and 1 *Plectrotrygonus pictus* (possibly 15"). The largest gufda was about 10 lbs and 3" in length. About 23 fish averaged 100 lbs. The smaller gufda have thin black <sup>bands</sup> ~~stripes~~ at 12 - 15" which disappear as they grow larger. The black spots varied from few to several on the sides. The head was like teriola, but there were a few armed scutes on the caudal peduncle. The parrotfish were nearly rotten (20 - 24"), and the other fish were in fair state of preservation. I would rather have fresher specimens to preserve so I did not keep any. There was also one large 3 ft. grouper. The parrotfish varied from light green with light blue under chin to pinkish on the sides. I believe the shorter bodied pink specimens were ♂s, and the longer greenish ones were ♀s. The gufda were full of shrimp and some ♂ testes I saw were only near mature. When I hit the sack about midnight I was just about dead. The moon is getting near full again.

June 20<sup>th</sup> - It was calm last night, but there was a moderate

shamal this morning. Clouds came aboard, and there was general confusion + a mechanic looking over 2 broken down engines. Then the Tant started its engine and charged its batteries, and there was general noise, while we had lunch. I pulled the eel pots and had a few small filefish, etc. Abdulla pulled his gengurs and had 3 Ablabysus marginatus, for which I have been waiting so long. There was also Amyphorus. This afternoon, I went around the pier with the face mask, and saw nothing new, but I did see another dull yellow and blue pomacentrid. A few pounds of fish came in this afternoon, and the boys in our crew retrieved the leads hamer, shari, and mthoa which has a grey head and fine small hair like teeth, small mouth and red throat, and is probably a large Plectrohynxus though there is no yellow around the eye. This will bear further study. Concerning the guddar, the smaller specimens a foot or so in length with thin stripes are known as rabbit. I also think the term rabbit applies to other species of thin broad smallish carangids, but I may be wrong. I wrote the following to Mr. Ohliger. - Dear Mr. Ohliger: I am writing at this time to request passage back to New York on or about Sept., 1948. As you may know, my passport is good till Sept 16, which will be approximately six months from the time I left the States to come to Saudi-Arabia. My wedding anniversary is Sept. 13<sup>th</sup>, which constitutes the reason for this request.

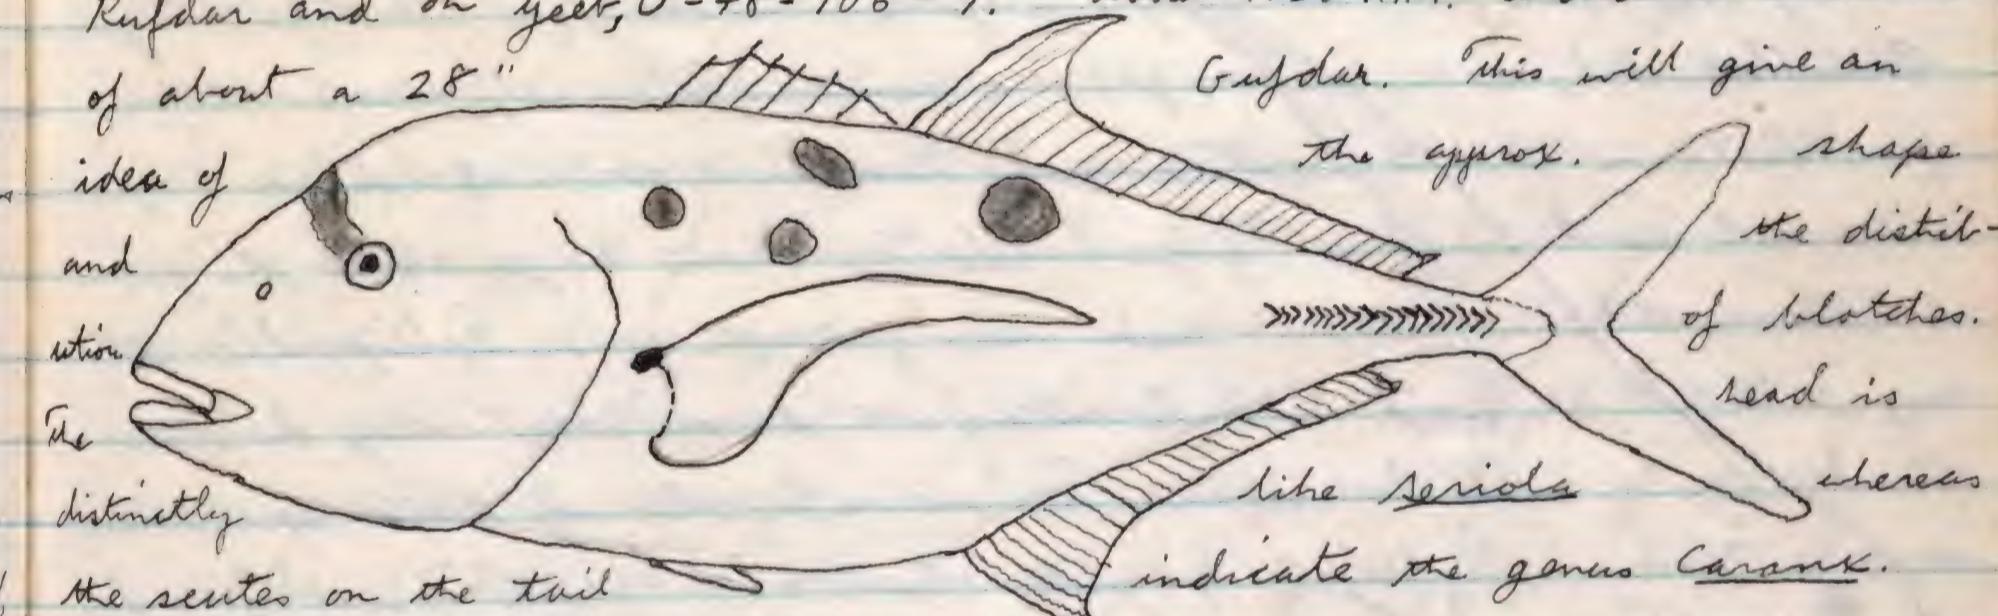

My first three months in Arabia have been barely satisfactory and I shall hope that the two months remaining shall be more productive.

I would also like to arrange a short collecting trip to Jiddah in order to compare conditions of fishing and fishes with here and the Red Sea. The National Museum is almost entirely lacking of fish specimens from both areas. I would suggest a week or

two weeks in Jiddah just before I return to the States, as possibly being the wisest use of my limited time.

Sincerely Yours, Donald S. Erdman

I mailed a letter to Suile and the above to Mr. Ohliger, and then went to the shanty to lie down it was 5:00 P.M. I woke up with the alarm at 11 P.M., and Ed and I went to breakfast and Mrs. Scott joined us and we went down to the pier. The fish seemed a little older than last night, and they had waited 3 hours. About half the catch was bad. Guddar was the main part of the catch, one Hamur, several shari, several parrotfish, and 2 new yeet (a new smooth jack), which they say will be more common later on. I saved 2 14" specimens; one rabbit sized Kufdar and one yeet, U-48-106-7. About 1:30 A.M. I drew this sketch of about a 28" Guddar. This will give an idea of the shape and distribution of blotches.

The counts on a 28" to tail fork specimen are as follows: 17 hard scales, D<sub>6</sub>, D<sub>2</sub> 18, A-16, P-19, lower gill rakers 21, eye 7½, head 3½, S.L. 28" and a rabbit sized specimen with black ~~stripes~~<sup>bands</sup>, 19 scales A-16, D II-19, gr. 22, eye 7, 14" S.L. The counts for the silvery yeet ~~or~~<sup>of</sup> yeet are D<sub>2</sub> 25, A 23, 14 hard scales, P 18, gill rakers 19, eye 4½, head 3½, depth 3½, S.L. 14".

June 21 - The calm again last night and early this morning. There was a moderate shamal wind blowing at sunrise and after sunrise. A load of several 100 lbs. of 6 inch shrimp came into the fish pier at 8 P.M. They did not look bad tho I would be in no rush to eat several platefuls. I had copious notes to tend to this morning.

I saw a six inch diameter solid white jellyfish with 2 small jacks swimming around it. Also recovered were several <sup>pelagic tunicate genus Salpa</sup> ~~Salpa~~ ctenophore shaped jellyfish about 2" which are transparent with a reddish ball at one end. They swim by contracting and expanding the body they swim. They are particularly abundant now around the pier, but I have noticed them all along and have collected them before. Abdullah captain decided to beach the boat today to fix a small leak which is still present near the port bow. What with the light motor in the machine shop and a lost oarlock, and indefinite delay; it probably is a good idea to sand the boat at this time. Early this morning the incoming tide crashed the pier against the south side of the fish pier which broke off some of the fish pier, which probably can be easily tacked together again.

Abdullah Sol, seaman, brought me some dark almost black Platax from Bahrain, also Neipterus and Tetragon, V-48-108. Since Bleeker does not record

or figure Platax, I am hazy about the genus but know that these fish belong to the genus Ephippidae. At any rate <sup>around</sup> ~~around~~ <sup>was</sup> ~~the~~ <sup>dark</sup> ~~dark~~ greyish black with black fins. Here I will attempt merely to reproduce roughly outline of this species. I touched up an article for "Scars and Flare" on local fish color which

During the day we ran the boat "Palestine" up to plug a couple of small holes over on the south side of West Pier. I wrote notes and wrapped fishes all morning. This afternoon some large groupers, "Hamoor"; shark, Plectosyphnus, and several snapper groupers (I got one to pickle V-48-111.) About 5:30 P.M. Ed brought a 4" charad down the pier which he had saved from the shrimp catch. The shrimp catch came from Turat Rd. and Turat Bay. This charad had

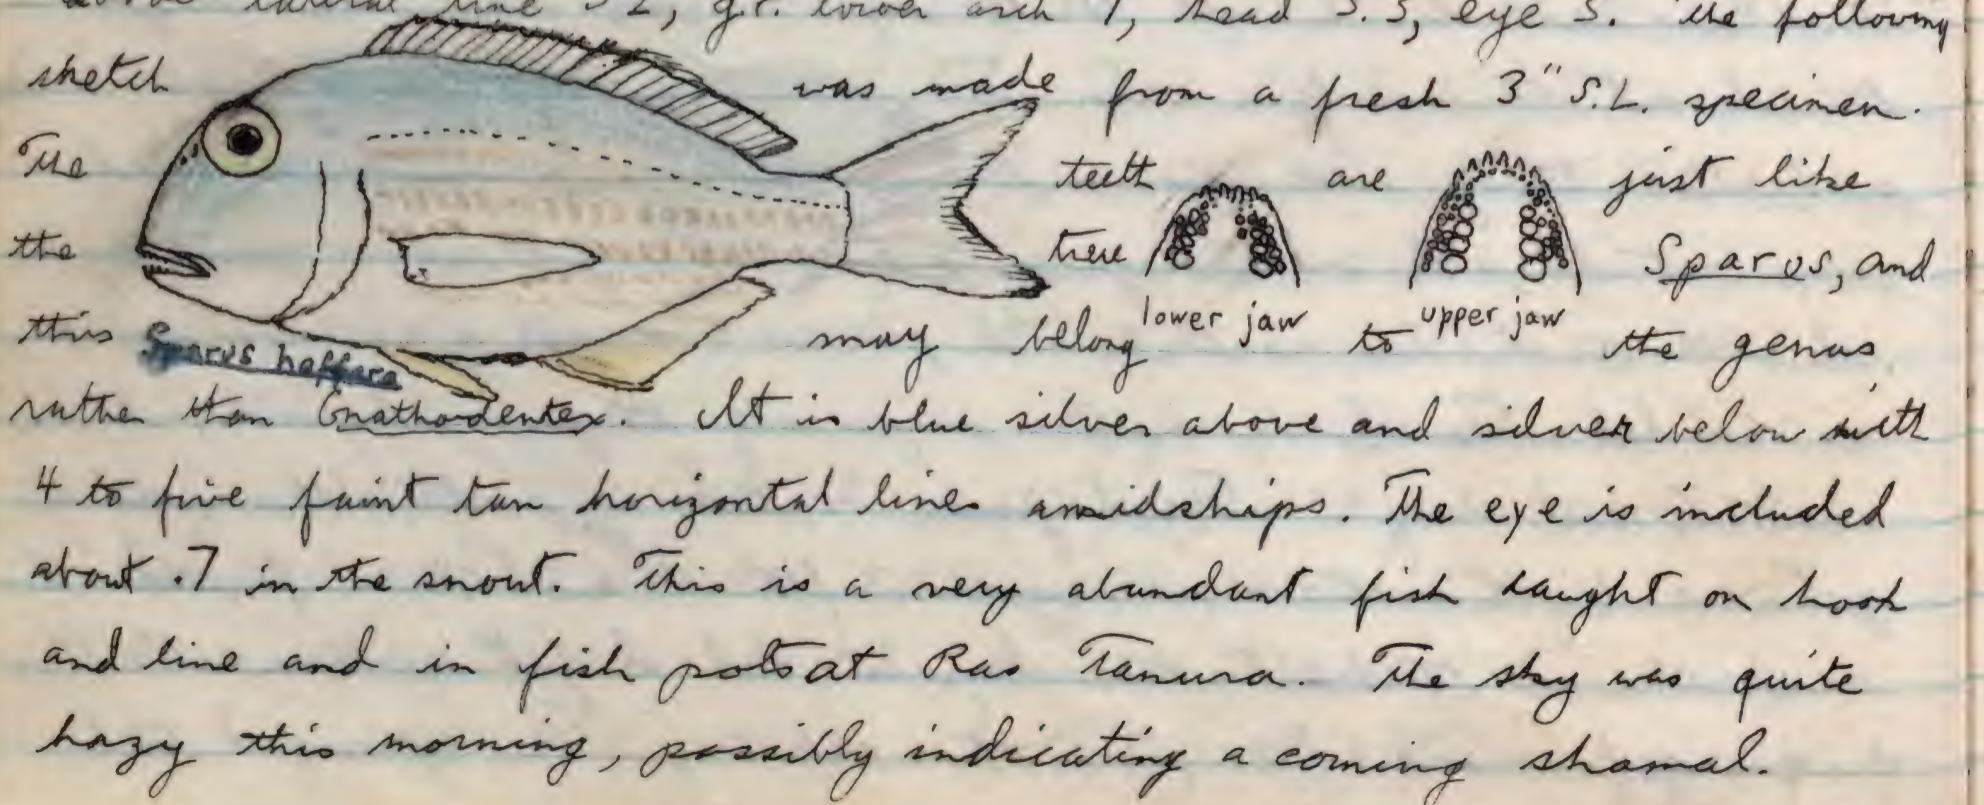

an all black dorsal & 1, and had the beginning of irregular grey bands on the sides, and large teeth. The gill rakers were still rudimentary and therefore not countable. It is likely that this is a this year's fish, possibly hatched sometime in April? At this point, I will mention that I saw adult and young Terapon (the tarpon variety) over near the sand beach on the south side of West Pier, in the afternoon on an incoming tide. Troubles occurred with the Tarot crew, but Suede and I finally got up to Had al Rum with both boats to fish for the night. The light "Kohler" motor is still in the shop so no night light fishing. We set a shark line and had no luck again. The seining was very poor with the outgoing tide tho, I got a good collection of small stuff. Guts gubs were very numerous. With the big mesh conpany seine we made one set from shore and got one crab, and another set and we got a large piece of branch coral which nearly tore the net, and a black long spined sea urchin. The night was calm with a near full moon and flood tide around 6 P.M. The moon was rather orange near the horizon because of the dust.

June 22 - A moderate shamal sprang up about 2 A.M. and at sunrise it was still moderate from 7:30 A.M. to 9:30 it blew real hard with white caps on the bay. Then it flattened out to nearly a calm.

The eel pots were productive today with two small yellow tailed pomacentrids, and a olive green and yellowish ophichthid eel with the tubular nostrils and prominent dorsal & anal fins but no caudal. The eel also had a propensity to go backwards. It was about 2 feet long. The day was wasted in port, altho we did get our light motor back again after it had been fixed. I used shrimp to bait the eel pots and I got quite a collection of queenfishes and Neipterus this evening. This evening I took

a few notes on the 580 lbs. catch of hufduks, etc. that came in about 7 A.M. 2 Rachycentron weighed 35 lbs together one was about 3 feet the other around 30 inches. The 3 ft. one had a whole good sized mole lobster in its stomach, and the counts were as follows, P-19, O VIII-34, A I-24, Lower G.R.-8. It was a ♀ and had large flattish oval near ripe ovaries. The hufduks larger ♂ & ♀s had near ripe gonads and their stomachs were full of crab pieces which were probably chum. One 30" Gymnammodytes was a ♀ with near ripe roe and O VII-20, A 2-18, P 17. There were also a couple of 14" yellies.

June 23 - Calm last night with light west breeze before & after dawn. Smede speared an 8 lb. 24" snapper, V-48-114, at flood tide, a picture was taken. He speared it near shore on the north side of the fish pier. This is a nice typical specimen and I am glad I did not feel obliged to give it to the crew; at 9:30 the fishing launch came in with shrimp and they had a 38 lb. cobia Rachycentron 41" S.L. and 50" T.L. I took 2 photos. I also hauled the eel pots, but there was nothing startling in them. Counts were taken on on that nose "gergufon" as follows O XII-13, A III-11, P-14, line of scales above lateral line 52, gr. lower arch 9, head 3.3, eye 3. The following sketch

was made from a fresh 3" S.L. specimen. The teeth are just like true Sparcs, and this Sparcs before may belong to the genus rather than Gnathodentex. It is blue silver above and silver below with 4 to five faint tan horizontal lines amidships. The eye is included about .7 in the snout. This is a very abundant fish caught on hook and line and in fish pots at Ras Tanura. The sky was quite hazy this morning, possibly indicating a coming shamal.

Letters to folks, Lucile, Edith Goode, & J. Mahoney (article). It blew hard starting about 10 A.M. but it flattened out later in the afternoon still in the northwest. I went into town to write and mail letters. I came out after early supper with Smede to leave about 6 P.M. for ~~Ras Tanura~~ Ras Tanura refinery area beach. We caught one 1 ft. long Lagocephalus. Smede speared it under the light over the side in about 1 fathom of water on hard sand bottom. There were cuttlefish also on the bottom. The bottom was hard enough to bend up the ends of the spear. Abdullah, Saif, and I went ashore to seine a bit we took 2 minnow seines the 20 ft. & 100 ft. We only used the small seine because the tide was falling fast and was low and the fish were few. There was a flat calm and low ground swell. We caught on 4" Sargassum, and small Aponotus thomsoni, Tetrapom, gerrids, Sillago and other smalls, but no threadfins which I had hoped to get. We returned to the fish pier about midnight. Shark line & eel pots yielded nothing out there.

June 24 - Fair and hazy in the morning with moderate increasing shamal winds. At 7 A.M. near the flood on the incoming tide I noticed again quite a number of dil jellyfish. This particular time of the tide seems to be the worst for them. I phoned Miss Ashley this morning 70-J-1 per request from Mr. Evans, and after an hour or so got hold of Mr. Johnson who had received my letter thru Mr. Ohliger, and they said they could arrange my transportation to Jiddah anytime, and thought I should spend at least two weeks there. The more I think of it, the more I think I should leave now, rather than leave it till later. Because things are bogging down here, and I might run into more work than I would expect over there. The shamal increased to white caps in the bay during the morning. I offloaded boxes #5 & #7 full of fish to be taken to the ~~Ras Tanura~~ Shabran storehouse. I am in a quandary what equipment to take, but will

probably settle on an 8 gal. copper tank. The shamal flattened down a little in the late afternoon about 4:30 P.M. Around 4:00 P.M. Abdallah hauled the eel pots and there was a small olive green *Lutjanus* with blue green thin stripes that had him stupefied.

Another type of *Lethrinus* the "imook" was taken as these were also yesterday. It lacks the green dots of *L. nebulosus* and lacks the red gill cover of *L. miniatus* and it generally has predominant black blotches on its sides. Thus with another name it may well be another species. About 200 lbs. came in the fish catch about 3 P.M. and consisted of hamoor, shiai, sbaiti burtan (the black grouper), and a large 16" *Plectropomus* "shukkha". I started to pour formalin and pack a few things for my trips over to the Red sea. Also today I found out the right name on the black grouper sbaiti. It is burtan or sbaiti burtan, or sbaiti. This clears up the confusion of the term burtan. I went into town this evening, and went to the movies to forget Arabia for a couple of hours.

June 25 - Dusty horizon in the early morning and most of the day a strong shamal 15-25 m.p.h. till about 3 P.M.? with calm at sunset, and clear and cool night. Today Ed and I went down to the fish plant about 7 A.M. to defrost it. The water around the pier was murky from the shamal, but Svede was still trying to catch sbaiti. Then Ed and I drove to Shabran because he had some friends and business to do. We arrived at Hassan Monsoor, the Taihat fishing contractor home about 1 P.M. I checked the pond where I good my first *C. dipher* at Safwah, and it was nearly dry. There were still a number of minnows there but no frogs. There seemed to be no visible outlet. But the water felt surprisingly cool. At Hassans we were ushered up to the cool second story

U-48-116

of a typical sea rock Arab household. With shade and mats to sit on and high ceilings with holes; there was good natural ventilation. We passed through a dark alley to get there on saw an Arab woman milking a goat in a dark corner. They were both the same color-black. About 20 personages from 2 to 60 gathered around us in more or less silence. And they were all males of course. Without an interpreter we did not get far except for a little discussion about fishing.

At least one round of coffee & tea was served before we went down below for lunch. One boy was completely blind, and another was blind in one eye (syphilis probably). About 20 of us sat down to lunch with the meal laid out on the carpet.

The main dish consisted of a whole sheep head & all on top of a large mound of curried rice, and about 17 side dishes of canned fruits, native melon, raw onions, fried onions, grey tapioca, grey sweet stuff, small hard boiled eggs, a small tough chicken one each on rice for Ed and I. To start with Hassan sprinkled gooey ghee on everything that had rice; then we all dove in with the right hand. I almost got my signals mixed once by reaching for the peanuts with my left hand. I did not eat too much which was bad manners but better for yours truly. Then we were left to rest in the room alone with the flies. After a long while our host returned and more coffee, more tea, and more sweet milk, and so on and on. Then at last a walk in the date garden; but no we must visit Hassan's brother down the street, and more coffee more tea etc. etc., but it did come to an end, and we saw the date garden and got some not yet ripe yellow dates. And I saw a small fig tree for the first time with curiously

cut leaves. We finally left Haasan's about sunset, and he gave us 2 pairs of sandals, and we must come again. We returned shortly to Shabran, and I attended the movies, and Ed saw friends.

On the drive back, we had a good talk, and I became convinced of Ed's sincerity in his work, and we moved at some wrinkles. If for nothing else than that, the day was well spent.

June 26 - Dusty sky again today with average strong shamal. I found out by phone today that there was a plane to Jiddah on the moron. So I rushed out to the pier, and worked like a beaver getting my stuff together. I finally ended up with a 16 gal. can of cube root, and a box stuffed with nets, and bottles of formalin. Mr. Scott helped me get on the Shabran bus, and I made Shabran about 3:30 with 3 others along. Things were more or less fixed by Mr. Johnson when I arrived, and I got a room for the night, got a haircut bought a shirt. I saw Jim Stewart tonight and had a good chat. I also wrote letters to Schultz and Lucile. King Abdulla of Trans-Jordan and his retinue were driving all over the place, and the place was alive with Arab soldiers.

June 27 - Shamal in the early morning with visibility less than  $\frac{1}{4}$  mile. I got up about 5:15 A.M. had breakfast and was stupid enough to mail my key. The dispatcher appeared at 6 A.M. with a taxi, and my driver smelled like something between a slaughter house and a dirty sock; so it was good the wind was blowing. My driver barely knew how to drive but he was good hearted. By 7 A.M. I was back in the house again, and the door was locked. The airport was closed to all outgoing planes. They hoped it might clear by 4 P.M. but have doubts. Because of weather all flights were cancelled, and I remained the day in Shabran, and wrote a letter to Mother (Mendom) and a provisional reply to Eric Maurer's idea of a round the world cruise included in another

letter to Lucile. The idea of a cruise appeals to me though I fully realize the sacrifices and dangers that may be involved.

There were small cumulus clouds in the sky above the horizon this evening. The horizon was still dusty.

June 28 - 5:30 A.M. a shamal is in evidence with dust all around. I saw a few clouds at 5:00 A.M. now I see only dust. It is rather doubtful to me that the vision will be much better this morning than yesterday. When we reached the air field you could still see a shack about  $\frac{1}{4}$  of a mile down the field; by 7:30 A.M. you couldn't see it. For a while we were going off on 672 but because of one failing motor we changed to 673 and I got my stuff on the plane at the last minute without customs even looking at it. We got our seat belts fastened; then the pilot walked back and said it was all off, but I left my formalin & nets and collecting can on the plane, and just took off my small bags. About 10 A.M. I got a ride back with Mrs. Truin?, who was also trying to go to Jidda. I called Mary Leonardini to say that I had not forgotten that she wanted me to give a lecture, but we decided it would be best to put it off until I returned from Jidda. Apparently the dust is all around again today, and I was glad to get a shower to get rid of some of it. Letters to Lucile and the Bertrams. I wrote up a fish list of fishes collected to date for Dr. Schultz. 97 species have been collected and pickled. 112 species have been observed and roughly identified.

June 29 - It was worse this morning than all the other mornings. The desert dust was hanging in the sky all over. Visibility may have been  $\frac{1}{8}$  mile. I called a taxi to go to the airport just to make sure and nothing doing. I returned to the room and wrote up a list of fishes with arabic, scientific, and rough English equivalents. I totaled 76 arabic names; plus 19 names of other marine animals or plants. At 1 P.M. I heard about the plane leaving and thanks to Jan Petersen in a Red D-X

I made it. We left the field about 1:30 P.M. in a shonan boat with fair visibility. Nevertheless until 3:00 P.M. there was too much dust to see land. But between 3:00 & 3:30 P.M. we passed over several towns and date gardens in the middle of the desert. At 3:50 P.M. at 11,000 ft. the temperature was 22°C in the plane and 20°C on the floor, and it felt cold. At 4:30 P.M. we saw big cumulus clouds to the west. Then we passed over reddish sands, salt flats, white sands, tan sands, brown and finally a belt of larval black sand. Also we passed over rocky hills of moon rock, and sand rock mountains. We reached Jidda about 6:00 P.M. and saw camel trains going off into the desert, and we saw the Red sea. Aramco house is situated conveniently at the edge of town and not far from salt water. There is an inlet with rock and sand bottom and Elodea growing at its edge which a native was picking and putting in a basket. The quarters are good here, and things look bright. There are shows in the harbor and there was a good red sunset with small rounded cumulus clouds.

June 30 - Fair and clear this morning with a strong breeze from the northwest. After breakfast, I walked around town and watched the various sights including colored women pounding grain.

One woman had a baby strapped on her back while she was pounding away. Every time she hit the grain the baby got a jolt, and somehow he or she did not enjoy it. I saw a fisherman going down the street with a pole over his shoulder a large Chorinurus at one end 3 ft. and a 3 ft. Cyprinodon corneri and 2 or 3 small Tylosurus at the other end. Another had a string of smaller fish including Zethrinids, Scarus ~~Scarus~~ and blackish green wrasse, and a goatfish.

The rest of the morning, I put all the rotenone in tea flour bags, and found several leeches in the bottom of the 16 gal. tank

### Brain corals

Gobat Ashra

which I got fixed up for 25. This afternoon, I walked along the small cove just north of the main part of Jidda which is not far from Aramco house. The west shore was mostly rocks and Elodea the north arm was mud sand with green sea weed (something like Big Mud) with hundreds of Cyprinodon dispar all around. The males had the yellowish dorsal and distinctly banded square caudal, but I did not catch any, only a small blue crab. There were also numerous mud hole crabs like fiddlers only the claws were equal in size. Then there were hundreds of pointed snail shells (I collected some). It was low tide, and the water deepens very gradually, somewhat like Tarut bay.  There were strange looking conch shells with a forward projecting point, just the opposite of the usual conch shell.  There was also a branched kind of sponge on the beach. The small stems were ~~yellow~~ greenish, the larger stem rusty brown. Numerous dilapidated dogs lay in the sand along the beach in one spot.

July 1 - Up at 5 A.M., which is an hour or so after sunrise here, Stuart Campbell took me out on Sans pier, belonging to S.A.M.S. Saudi-Arab mineral Co. which is about 2 miles north of Jidda at Ruais. It is at least a  $\frac{1}{4}$  mile long, and is a scarce fathom and a half of water at the end of the pier. The water for a long way varies from a few inches to 2 or 3 feet. Off the end of the pier we could see sergeant majors and snappers and also white redmended doctorfish. On the north side of the pier a 100 ft. in from the end was an interesting area with brown sea weed, scattered coral, and hard sand bottom. Pomacentrids, butterfly fishes, and spot snappers were in good evidence. Mr. Campbell's name for the shrimp in the holes with the Periophthalmodon is "bulldozer fish" the otter is the "watch dog". The Periophthalmodon looked similar to the Persian Gulf variety, but may be different. I thought

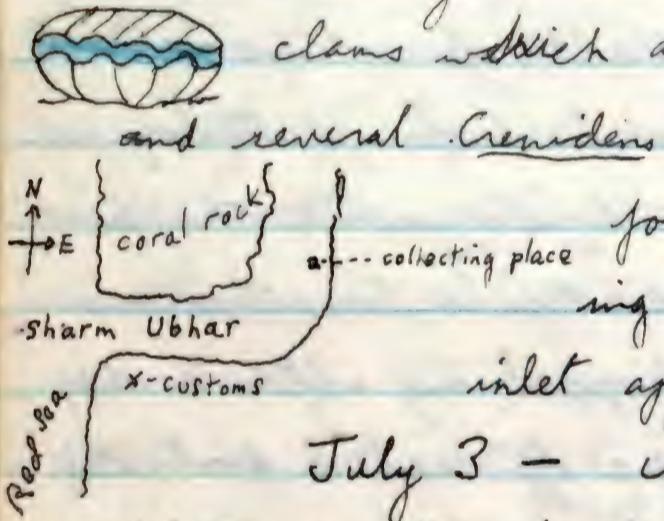

the place might be worth a try for poison. So I returned for my cube root, and returned and mixed about 4 quarts of dust with water, and spread it around some rooted brown weed and coral at about 100 yds off the dock. Since there is almost no tide at this point in the Red Sea; (water level is changed by high winds only) there was almost no current. There was a slight drift towards the dock, and where the reef dropped off to 4 ft. of water the poison drifted slowly in the opposite direction. I filled a gallon jar solid with small fish and could have filled one or two more, if I had brought them along. A species of agron (like A. thurstoni, but another species) was knocked off like flies, black pomacentrids were also greatly affected (contrary to the ones in the Persian Gulf.) But even atlantic and herring were affected. Snappers did not get affected, and I saw no porches. My success was due I think to several factors: the nature of the bottom, no fast currents and shallow water in the vicinity. I also saw Hemichthys and Dascyllus aruanus which I did not catch. I got approximately 100 specimens comprising 34 species in one collection. This afternoon, I went out again with Hasen & Oli two drama boys in a jeep up as <sup>Gubat</sup> Ashra about 8 miles north. At first we stopped the cove next by to seine some Cyprinodon dispar. <sup>Gubat</sup> Ashra is a reef rock area ~~but~~ unlike the south coast of Santo Domingo. There was a long curved reef beyond with shallow water inside and the rough sea outside washing upon it and setting up fairly strong currents. The smell was like that characteristic sea smell of reefs and salt water. I used some poison and got a new wrasse & blennies and a new Ablabys <sup>scutellatus</sup> which was sand colored with a black spot and some black markings. Further on I saw specimens of this Ablabys 4 and 5 inches long darting back and forth under a large reef rock. They reminded me of A. taeniatus at Tobago keys. There was a pretty sunset with considerable cumulus clouds and continued strong north west

winds. The sea birds I have seen include dusty bellied terns, long beaked terns, and small blue grey herons. I have also seen several small hawks around the town. Around al Gubat Ashra the mountains are visible to the east, and the ground continues to be the same odd dark brown color characteristic of the shore here. Oyster weed was common on the reef ~~as~~ just as in the W.I.; there were also other kinds of dark brown seaweed. In fact the oyster weed was dark brown rather than light tan. There were some Arabs around and 2 had throw nets. Near Ruais we saw a half dozen long seine nets staked up, and drying on the shore.

July 2 - It was calm at dawn this morning, but a moderate north-west breeze soon came up. The boys took me out to Sam's pier again, and I tried another 5 or 6 quarts of rotenone. There was a dead moray eel floating around from yesterday. The black agononids and black pomacentrids were the first hit, then we got a couple of very beautiful cantharus black with thin light blue stripes. I dropped my watch on the stone stairs yesterday, the face and crystal came off and I lost the second hand, but it still runs. I just finished caring for my specimens, and Oli, Hasane, and I went off to Gubat Ashra. We tried the reef near the reef rock. I poisoned around a rock in the water, and only got very small pomacentrids. Finally I decided to use the rest of the mixture in the brown weed near the breaker, <sup>deep sea</sup> <sup>brown weed</sup> <sup>old rocks</sup> <sup>shallow reef</sup> I dumped it in one spot reef area all at once and did not expect much; the results were stupendous. The wave current <sup>year</sup> beat the cloud, and fish passed through it and we were busy for an hour picking up fish. We saw a black tipped fin of a 3½ foot shark floundering around on the reef. Hasane went over but it swam off into deep water when he shouted. The gulls were

helping themselves to odd specimens. Then we passed on another 5 miles to <sup>Sharm</sup> ~~Ubhar~~ an inlet from the sea through the coral rock. The inlet was about a  $\frac{1}{4}$  mile wide at its mouth. A coast guard hut is on the south side. We went about a mile & half west & north along the inlet and stopped. I poisoned around a large rock in shallow water 6"-1 ft. deep, and also around another rock. I think I used more cube root than necessary (a 5 gal. paint bucket almost half full of dust), but the results were quite satisfactory, consisting of a number of *Balistidae*, *Bathygobius*, a *Banacuda* etc. I saw some brown coral rock where the fossil coral could still be plainly seen. The bottom was reef like with some black mud.

We returned after dark. I brought back a couple of <sup>Tridachna</sup> man-eater clams which are a beautiful yellow or blue inside. A *Lethrinus* and several *Ctenidens*? were an addition to the collection. The following map indicates the approximate collecting place, U-48-124; generally the water all over this inlet appears to be very shallow.

July 3 - I worked hard trapping and drawing and making notes of fish specimens this morning, from about 6 A.M. to 10 A.M. About 10:30 A.M., Ahmed Rashed, Hasane, and Abdul took me down to the "souq" to the fish market which is at the end of the arched canopy. There were very few fish, and I was almost discouraged, but I am glad I decided to stay behind with Abdul. Pictures of life unfolded rapidly for the next hour or so. An old fisherman almost blind helped on the names of fishes near by, then we went back up the street and stopped passing fishermen. All fish are apparently sold direct by the fisherman to the consumer or nearly so. They are carried on both ends of a stick and are tied thru the gills and mouth. One fellow at a café bought a beautiful 1 ft. blue

parrotfish from a passing fisherman. The fish as a whole seemed quite fresh, and the colors were rich varied and beautiful. Brilliantly colored wrasse, parrotfish, and doctorfish were on many strings as we passed along. Abdul repeated the names, and I wrote them as best I could. Tomorrow, I hope to try it again with the camera.

 We went right down to the boats on shore where fishermen were cleaning their fish, and old fish heads lay around indicating former cleanings. On our return trip we stopped at 2 fish friaries, where fish are cooked over wood fires fried in grease and are sold to passing customers, which is not a bad idea at all. In fact, they looked and even smelled quite appetizing. I got 28, arabic names and saw at least 35 or 36 species of fish, many brilliantly colored. In general wrasse species were classed under one name, parrotfish under one name, *Lethrinus* & *Ornithodorax* under one name, etc. Apparently the distinction between species is not so strict. One *Scarus* I saw had very much the red & the green colors of *S. dussumieri* of the Persian Gulf.

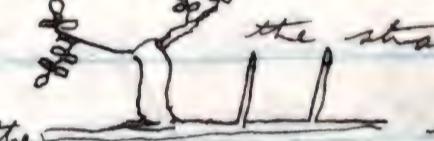

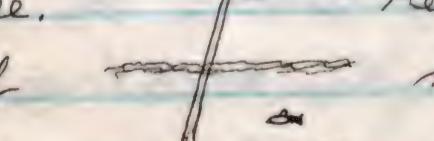

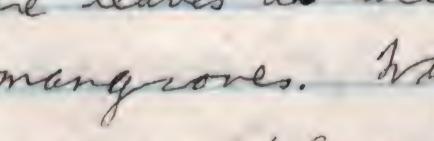

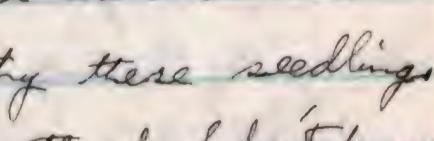

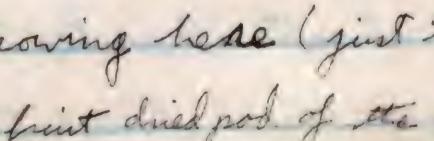

This afternoon about 3 P.M. I went out with Ali in a launch to look at the sea. There were 8 on the crew of the launch. Inside the first reef the water was shallow and murky. But between the inner and outer reefs the water was clearer and deeper several fathoms in spots, but there were dangerous shoals and reefs all around. We went outside the outer reef and got a slight roll from the sea, the wind was light from the west. We went south about 2 or 3 miles to Abu Sad, an island with buildings. It is the quarantine island. The two Arabs who stayed there invited us ashore for coffee. Then we left and returned to the outer reef south of the channel entrance. It is about a mile or mile and half long and 400 yds wide, and only a foot to 3 feet of water on top of it. I used up the remaining poison in the first flour bag. The wave current was stronger across the reef than I thought so I made

a mistake in putting the poison all in one spot near the surf. Nevertheless the capture of several worm eels, *Taeniurops*, and a new wrasse probably made it worthwhile. <sup>Small</sup> Gulls almost black in color helped to collect specimens for themselves. A lot of small silverside were hit.

This evening, I went out to Sam's pier, and waded around with the spear. I tried the windward coral side first but saw nothing; so I went to the lee side where the bottom was mostly mud sand. I saw a large grouper black and brown (possibly 3 or 4 lbs) lying still in the open on the sand. I got poised with the spear, but he didn't wait. Then I speared a crab out of disgust which was fatal because I saw a *Platycephalus*, and missed it on account of the crab. Then I saw a black sting going along, and it was a fair sized sting ray. I speared him but did not gush hard enough. There was a great commotion and it got away, and cut close by me; so it was not pleasant. Then I saw a smaller one. I hit him or her twice before I could shore the spear thru. I saw it when I had a *Siganus* on the spear. Needless to say I pulled off the *Siganus*. Near the dock I saw an octopus and speared it. Mr. Campbell came along about that time. With 2 specimens to care for, I thought it a good time to quit. On the windward side of the dock in the reef grass there was a great deal of phosphorescent animal in the water, like small sparkling diamonds. Silversides and halfbeaks were attracted to the light. I also saw gerrids as well as *Siganus* on the bottom.

July 4 - I went down to the fish market with Hasane in the jeep about 9 A.M. There were alot more fish than the other day, but there were not any highly colored wrasse or parrotfish. The most abundant fish was salmoni a long fat round cleftoid about  $20^{\circ}$  T.L. with a forked tail, and it looks something like *Elops*. Mullet and 2 kinds of jacks were also plentiful. The flies, however, exceeded all else in number. I took one picture of 2

black panots, a red squirrel, and a black *Siganus* (1 royal). The rest of the morning, I worked on yesterday's specimens. I saw several new fish including a spadefish (or possibly it was that large grey *Acanthurus*), and a silver groper shaped fish with black dots.

This afternoon, I went with Hasane and Oli south of the city. The desert is whiter sand there, and there is no hard road, the beach is sand going down to water with mud sand bottom which is very shallow deepening to about 2 feet gradually. There were several small sand & reef rock islands. One we waded to had small trees on it they looked like mangroves with  the straight sprouts, but there were none in the water. And the largest were scarcely 2 feet high. Several islands further out had more and apparently larger trees possibly 4 feet high. There were blue crabs, 2 crabs, and shrimps, and a *Platycephalus*, a *Cyprinodon dispar* in the water. This water runs behind outlying islands and reefs, and probably accounts for its character. We went on a little further south and saw a few dug out canals in the distance, but about the same type of bottom. In fact the mud was so soft we sank too deep into it for comfort, and it is so mixed with coral sand as to be sharp & uncomfortable. Thus the shore south of Jidda is rather less productive for collecting than the shore to the north. We also saw a few large almost black heron, a couple of terns, and several small white gulls. The jeep we had was always running out of water; so we had our troubles, and returned about 4:30 P.M. At the last spot we stopped at there were three seedlings three or four growing in about 10" of salt water about 50 feet offshore.  These leaves as well as the other trees were reminiscent of  mangroves. Why these seedlings were growing here (just three  or four widely scattered, I don't know.  The first dried pod of the tree was cylinder shaped and reminiscent of a wasps nest in appearance.

The mountains were clear in the back ground to-day and the wind was breezy from the north west, and the flatness of the desert created considerable mirage. This evening we were invited to the American legation, Mr. Childs is consul, and he mentioned to me a fishing trip Thursday. Two I.B.I. fellows, <sup>m.</sup> Ross, Spence, & Linsey invited me fishing for tomorrow. I also met Bud Babcock, whom I did not recognize at first, but he spoke of Orient and Caroline, so we had quite a talk. He works for Sams. as does Mrs. Powell.

There were drinks, & movies on the roof, and the evening was pleasant and I am glad that it went. <sup>Mr. Linsey, & the Bechtel boys</sup> <sup>2 cottontopfish seen at surface</sup>

July 5 - We left the pier about 7 A.M. in a 20 ft. launch with a kerosene motor and 2 rather sullen sedans and we trawled around Jidda harbor with 3 spoons inside the reefs. About 9 A.M. just inside the outer reef at the south corner a large jack Caranx sp. was landed. It looked most like C. latifrons but did not have black fins. It was grey green on top and silver below and clear fins. It weighed about 20 lbs, a ♀ neviriped (?), 33" to tail fork, depth 3, head  $3\frac{1}{4}$ , 28 hard scales, P-20, D II-17, A-II-16. Gill rakers lower arch 12 + 2 rudimental. <sup>clear scale</sup>

Native name "ghurm"? It was caught near a reef. A half hour later in marshy water we caught a barracuda ("Agam") 14 lbs. S.L. 38" A-9 D-9, and it looked very similar in size shape and coloring even to after black blots of Sphyraena barracuda. We stopped at a reef a while to eat, and I examined a deep large coral protuberance. Acanthurus with white peduncles was most abundant, also <sup>light</sup> <sup>chromis?</sup> blue, damselfish, like pink a blue parrot, Dascyllus, a small black & white wrasse  which I approximate from memory. Hemichthys, Ablabys marmoratus, Ctenodus (2 species) etc. It was calm in the morning with a northeast breeze starting about 11:30 A.M. We trawled the surface without heavy lead. I also saw some blunt headed snappers about 14 inches T.L. I saw 2 or 3 ospreys, and a couple of pelicans in the distance.

This afternoon, the wind died again. Ali, Hasane, and I drove again to Gubat Ashra. The sea was calm enough so we could wade to the reef's edge and look into the seas blue abyss. At the reefs edge were myriads of fishes, and near the edge coral of all colors purple red, bright green, tan, grey, and brown. Rather than make comments I will list the species seen which are new: Acanthurus with 4 orange spines a lady Nasus grey in color sp. unicornis, Megaprotodon? orange yellow and black but not the same as the P. Gulf variety, Cirrhitus (brown, blue, & tan), red grouper with blue spots, grey shark, 3 feet, with black and white dorsals, black pomacentrid tiny but with white tails at the outermost edge of the reef, Pterois with its gloving fins, 2 tremendous, 5 lb. & 3 lb. wrasse?, they were dull grey shaped like Tethindes but with a wrasse like tail and big scales, black blue & white wrasse, a 10 inch black wrasse with a white blotch on the side, a Caranx with fine black spots & heavy head 10 inch specimens with bright blue back; old 30" specimen dull green on back, a slate Ostracion cubicus; the other specimens like Ctenochaetus had <sup>rock</sup> opposition or rather were actually collected. In shore next to the reef the temperature of the water was  $32^{\circ}$  centigrade. The air was  $35^{\circ}$  c. Derrid and other fish were swimming around in the hot water.

July 6th - Up at 4:30 A.M., had breakfast, and worked on my fishes collected yesterday. Some of the larger ones did not have good smelling intestines, and I probably should have cut their bellies last night instead of this morning. I did not feel too hot today sort of like having a cold for a long time, but I went down to the fish market with Hasane (as the fishing trip in the sail boat had folded up). We found a few fish to take pictures of and I got away with one real. This business, however, is not very successful, since they are loath either to stand, or especially lay their fish on the ground. The wind came up about 10 A.M., then it was too late. Hasane loves the sea, and has worked on several freighters. The salmoni are

caught in nets  and run about 18" long, and run about 1 lb. or 1½ lb. for one real. They are among the most abundant fish in the market place especially early in the morning. They soften and spoil rapidly. We saw one fellow with about 2 dozen strung on a pole, and the fish were about ready to drop off like over ripe apples, and the body was almost mush, and the eyes dull red & sunken. Whether or not they smelled I could not tell, because I had just been thru the "sug".

This afternoon, Hosane, Ali, and myself went to Dubat ashra again. None of us were energetic, we were all waterlogged from the other day. I spread the poison at the reefs edge but with the small amount I still have left; it is not really enough to do very much. I think we got a new *Tetronias* and also a new *urasse*. I saw a crow this afternoon not far from Sam's pier.

July 7<sup>th</sup> - Today was the beginning of Rhamadhan, hence there were a lot of cannons shooting off in the middle of the night. I was semi-conscious of the noise. Though I felt somewhat better than last night, I have acquired a cold thru an overdose of salt water in the nose and ears. The slaps of the waves at the reefs edge makes it uncomfortable. I straightened out my specimens collected yesterday. This afternoon I visited the Bechtel office, and Mr. Tinsley showed me his tide records; 2.6 feet is the greatest difference between high and low tide. .6 and .5 in either a half foot or less are most common. They also keep temperature and humidity readings 92°F and 79°F humidity at about 3 P.M. with a strong northwest wind. I also saw the chart of Jidda harbor & approaches Brit. Admir. 209.39 reprinted by U.S. Hydrographic 1942. Last night about 5:30 P.M., the sun sets at 6 P.M. I noticed a tide pool connected for the first time with the muddy inlet just north of Jidda. This is the

first bid of tide, I have noticed here yet. The fishing trips with Hilda is called off Thursday on account of engine trouble. I advised Stuart V. Campbell that I was ready to leave in about 3 or 4 days. He has been very nice, accommodating, & helpful during my stay here. The task is nearly full now, and there is not much poison left. This evening the doctor writhed with pains, and had a cold, Hosane and I went spearing off Sam's Pier. A flathead and 2 new bloafish were the reward of the trip. Mr. Tinsley of Bechtel also waded around with us and we had two spectators on the dock; we saw a small black spotted ray but missed him. I got to bed about 10:30

July 8 - I managed to maneuver downstairs to trap last night's fish, but I am without energy. I finally got a chit to go to Dr. Goret at the American Legation. My temp. was between 102 - 103°F, but he says 106°F is not uncommon here with nose & throat infections. I also got some penicillin shots, and in some ways I feel better than last night. My nose is not running but the cold is in my chest, another characteristic of colds in this region. We got on the subject of fish poisoning, and he was particularly interested in the barracuda. I told him the stories about barracuda vary all thru the East Indies. But really little is known about it.

July 9 - I managed to live thru the day without going into painful details. Dr. Goret came again and I got a shot in the other hind quarter. It is called Penicillin in oil & wax Schenley (1 cartridge 1cc) List #147 300,000 units crystalline penicillin & Potassium suspended in peanut oil containing 4.8% W/V White wax U.S.P. (Romansky Formula).

July 10 - I think I can say that I feel better today. Dr. Goret came, another shot temperature 101°F. The sky was almost completely cloudy around sunset. I coughed most of the day. Dr. visits.

July 11 - Still coughing like mad today, with fever. Dr. visits

July 12 - Fever still around  $102^{\circ}$ , cough not quite as bad, taking atabrine. This evening I moved down to the room downstairs. After supper, Hosane brought in 2 salmon (6 riyals). I injected them well, and outside of slight drying, I think they were in good condition.

July 13 - Fever and continued coughing. Dr. Gonet visited twice.

July 13 - Today mailed to Lacille via Shabran, two visits from Dr. Gonet. Fever has gone down  $101.8^{\circ}$  still have dangerous cough, and keep taking codine to stop it. Taking sulphur, atabrine, and codine for my cough. Last night I got sick after one cough in bed, and it just made it into the first basin, by the skin of my teeth and it was very thin, and I lost all my cookies. When I got back to bed a second I felt weak, but I slept very little during the night. Temp. of my fever  $101.8^{\circ}$  at 6:00 P.M.

(cont.) July 13 - Bastille day - My first meal was lunch today and so far I have kept it down. My bowels are very loose and moved at least 7 times including one during lunch, right in the middle of my lunch.

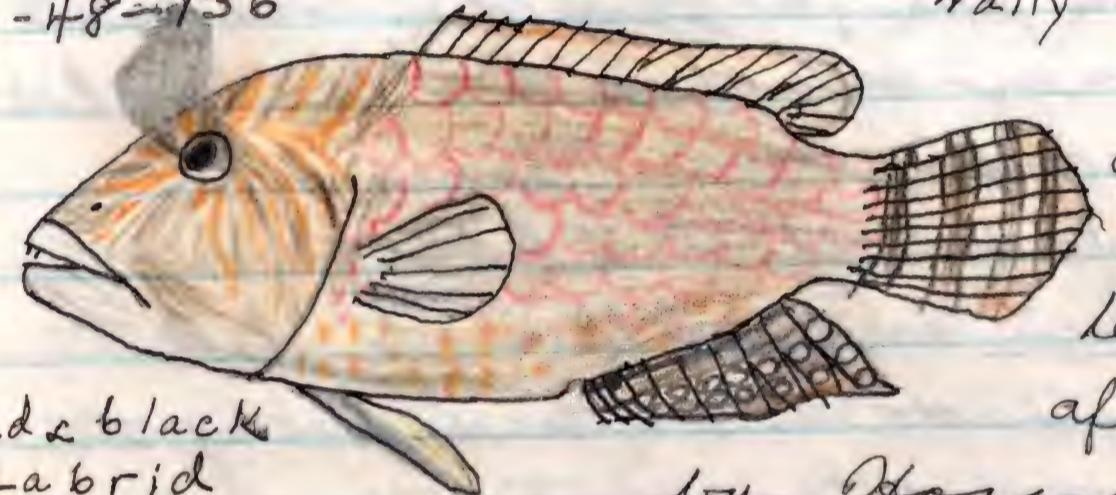

Dr. Gonet, came about 10 P.M. My fever is a little down  $101.5^{\circ}$  compared with last night. Dr. Gonet is doctor at the American Legation and his wife is a nurse. He is a Frenchman, and has worked before in Indo-China. He has been here in Jidda, only several weeks. He is rather short and stoutish with a Jewish nose, and he wears eye glasses and has thinning black hair. He appears to be very competent in his profession. I made great decisions to stick with the Museum, and do more for Lucile.

July 14 - Dr. Gonet visited this morning temp.  $101.5^{\circ}$ . I worked hard all day on specimens & notes, and I gave Hosane all my fishing gear to use. He was very willing, and he may pick up more stuff before I leave Jidda. Temp.  $101^{\circ}$  at 6 P.M. passionate love letter to wife, given to Mr. Campbell to send to Shabran. Dr. Gonet came again tonight, and he said he was sorry the fever was not down yet.

Juan Domingo Suarez - Puerto-Rican fisherman, working east of Cape San Juan, P.R. There seem to be more abundant varieties in the Red Sea, than the Persian Gulf. This entirely due, to the bottom character, of the Persian Gulf. No porpoises seen on the Red Sea in the vicinity of Jidda, also no sea snakes (*Hydrophis*) are apparent. Slight vomiting after supper, but I didn't lose much and arrested the cough with codine.

July 15 - vital statistics of my fever and bronchitis; pills total = 251, breakdown codine 30, aspirin 12, atabrine 15, cascara 2, sulphur  $48 \frac{Ca}{144} SO_2 OH$ .

v-48-136

Epinephelus (black)

Wally Turner still has my eraser

Total cash on hand as of today 100.2 8 guerche.

These fish were collected from Gabat Ashra after dark last night

by Hosane. I certainly appreciated the specimens, and I told him so. Thus I completed my chief work of the morning.

Dr. Gonet came about 2 p.m. today my temperature is down to  $100.5^{\circ}$ . I am yellow from atabrine, and am coughing up deep yellow phlegm today. I find that codine is excellent for controlling deep coughing. It has saved vomiting on countless times. He last week, Dr. Gonet visited about 6 P.M.

July 16 - The I did not feel too hot I slept most of the in brief periods. I had a midnight lunch. Am still living on codine. Pill total + 6 codine + 4 atabrine total pills 251. This morning I

I finished "The G-String Murders" by Gypsy Rose Lee. It was very real written and partly biographical and described stage life very well. Mr. Deonet came this afternoon with his wife. He said I had bronchial pneumonia which is often fatal; my temp. is 100° F. I will not leave for Shobran for three or four days yet. I am as weak as a kitten. Fish processed this morning, and I left this afternoon. The 16 gal tank is loaded. I need to stay here at least three or four day to recuperate. Hussein bought 2 "Butti" in the pm, V-48-142. The nabit or Zurmbuk is the man-eater ~~cat~~ of Jidda. In Port Sudan it is called "cocaine." genus Tridachna.

July 17 - Hussein arrived at 4 A.M. this morning with shark and Parapercis in tow. 10 Riyals. I just barely squeezed them in the tank after injecting them with 2 blows a piece of the hypodermic.

Hussein had this quaint story of the crab fishermen as the how the flounder has eyes on one side only. It seems one Hadji Sulaiman was eating a fish and he held it up to sun this one side turned dark with the eye, and the belly white. Allah caused the change. Hence it is now named as "Sainak Saida Sulaiman".

I had midnight lunch again tonight.

July 18 - I had two dreams this morning which were very vivid and stuck in my memory. They were in two separate parts a 1st & second:

The first started and it was on the Cornell campus and the bells were ringing. I had a few classes yet before the May Day bell, and I remember that came up and I got a date for her.

I don't remember my date at all and little about the dance but Larry was also there. The next morning we went off on a car drive into the green hills and wades up and down and around. We came to a creek and I remember seeing several strange Indians around. Just before I left the campus, I remember battling a large black & white billy goat who was following a tan & white female. tho' he had big horns he didn't hurt me much this happened in front of McGraw Hall. Larry helped me. The goat and I were even I had both hands on his horns but couldn't let go.

Finally we left the Indians who glowered at us and went on up stream seemingly undisturbed. We wandered far up stream and I near the headwaters which we reached near sunset. We saw a low stone fort near by the stream on the back of a hill. More likely it was an old mill stone house. Larry and I finally stopped looking under rocks and scaled the wall because some wild dogs were barking at us and a few Indians appeared again. We scaled the wall to apparent safety and there was an indentation on the roof and sort of a stone parapet around. Water was gushing in from the stream side because there was a dam but it didn't come through fast enough to fill more than one end of the spill way or trough which led to the spill way and turned the wheel I guess? It was odd and apparently not used. I remember trying to urinate because I needed to but the excitement was too much. I had to forego it except for a squirt or two. Night fell quickly and we didn't have peace long.

There was a long sloping roof with shingles attached to the mill and a plaiting down hill from there at a steep angle. Soon a whole batch of half naked savages started throwing fire darts at us and the roof was ablaze in no time with the heat and smoke of course coming our way as well as countless savages. Hell was breaking loose and one savage had almost scaled the roof on a side which had not yet caught fire, which was really nearest us. If we didn't leave then it would have been our end. Some flew down hill into the night over the heads of the murderous tribe. They were so intent on torturing us in the fort that they did not look up or shoot arrows in the sky we flew rather close over numerous camp fires. Then the dream blotted out and I had the shivers of a narrow escape. The second part, started with Samy and I in an Indian camp near by last night's place. We were sort of their slaves but if we behaved they were O.K. to us. There was some dancing going on but mostly just squaws and kids were around. It was given a bundle of raw hide horse reins two pieces, and Samy was given some candles. We were to distribute them thru each tent in camp. A little Indian boy led us thru. We didn't have much trouble or encounter hostility tho I had trouble picking out two different reins every time, and I got some grumbling when I made a mistake -- then the dream discontinued again, and I found myself outside a log cabin on a hill. It was night and the lights were on. I do-

soon inside. Red headed Pa was getting over a drunk and black haired Mo was scared with the children. There was an earthenware cask with a fairly wide opening near the wall. Pa had just cracked it with a cleaver because he knew Ma was going to pour the apple jack into it and set fire to it. Nevertheless Ma had another thing ready the cooking pot over the fire which she removed, and I helped pour the apple jack out of the can into the pot. Then Ma started quickly striking matches and throwing them in; there was a flicker of a flame, but no lish so we were foiled. Pa roared with amusement. So we passed the spider colored gravy around it was frothy on top and rather thick. It tasted a sweet apple taste; at first Pa was noticeably disappointed but then he cheered up and I shook hands with him, because he knew the joke was on him it was his own bad liquor. Thus the dream ended and I woke up to daylight. I seldom remember dreams or at least so clearly. So I hastened to wash this down as part of my case history. I had to urinate badly when I awoke and started to cough badly. But codine and aspirin and the bathroom relieved all shortly. The causal factors of the dream was sleeping on my back, my cold, my full bladder and that I was about to wake up. But how to explain the psychology of it I can only explain in part. First I went to Cornell 37-41 and this was the spring of my senior year. My girl, Bobbie had just married last fall; so I had no particular girl and was not attracted by any particular coed at the time. And I do remember asking Roz and Nat who came

122 Felix Vigo, Mr. O'highe re: plane  
Aug. 10 letter to Lucile July 21

up to a point that year or the year before. The goats are specific the female is Mr. Viernes' goat that ate all my sole dinas in Aguadilla, Puerto Rico. Other goats had filed on before but they were not the evil characters. The silly goat was Paco's goat Pepe. He was evil the day he was born and he almost ate up the week's pay roll one pay day. Roy Schall a tall blue-eyed blond was his A-I enemy. Roy could cover ground when he was mad and he could wield a stick. A chase between Pepe and Roy was a daily occurrence. Usually a loud "God damn!" and Pepe would fly out of the Recreation center with Roy shot on his heels. Pepe usually got a beating but it never bothered him. Larry had never visited Cornell; I asked him a couple of times but he never could make it. The grey rocks and green hills and valleys and blue streams are a common and beautiful site in the Iroquois country of the finger lakes. The Cayuga Indians had a powwow place up the lake on the Cornell side not far from Wells College. It was still being used, and I remember seeing the place on the brow of a hill overlooking Lake Cayuga. Also I have seen Indian wars in movies. This is my explanation. Wind strong northwest this p.m. I got an invitation from the Minister tomorrow. 3 invitations in all I have had to turn down for fishing!!! Damn, but my fishing career is over now. My fish springs was cleaned out this afternoon and the necessary washings in the Persian Gulf added just, so I duly cleaned all parts as well as possible.

7/20/48 letter to Lucile, folks, Hussein, Shalvan fishing club  
to go to supper Sunday <sup>123</sup>

July 19 - The first night I slept practically straight thru I feel a lot better this morning with Schultz report completed etc. with Red Sea Data a Puerto Rican plan. Strong northwest winds today with clear sky.

July 20th - I feed much better today and have a lighter I have lost quite a bit of weight and feel weak from my illness. I wrote a long preliminary report to the Franco Relations office and the fishes of the Persian Gulf and Red Sea. Fever 99.2°F at 6:00 P.M. Dr. Bonet I also got a sick leave slip from Dr. Bonet for bronchial pneumonia.

July 21 - Had best nights sleep last night and finished a letter to Lucile. And I feel better this morning. I took the plane out of Jidda at 2 P.M. It was a bumpy ride over and didn't help my ears. I got a letter off to Lucile and one to Stewart. I bunched a ride up to Ras Tanura since the 8 P.M. taxi did not stop by the clubhouse. I saw Tracy Leonardine ~~Sunday~~ in the new dining hall and she will arrange a lecture for me Sunday.

July 20 - Ed and I got up and had breakfast at 11:45 A.M. I am still coughing. Windy and sunny today Ed and I had fried shrimp and curvy mayonnaise for our supper. The boys have been collecting fish for me and Abdulla Soli caught a shaft hook line near sandbar. About 500 lbs of large groupers came in.

July 21 - Did not sleep well last night too tired. Ed and I got up about 7 A.M.; Scotty called us. It was windy with dusty sky with sun breaking thru 8 A.M. letter to O'highe re leaving on plane Aug 10th because of health. Fishery report to O'highe & Schultz Jr. also a

124 July 22 - Letter to Lucile July 22 letter to Hadley, Lucile,  
love & Austin Clark 2 Aunt Katherine & Mexican survey committee of A.F.S.C.

a letter to Lucile and a letter to Felix Iñigo telling him that we hoped to arrive Sept. 1 and hoped to do some collecting together. I saw a good movie tonight called the Barracuda it was a story of square riggers ploughing the trades between Cartagena and Roctegas. The girl was beautiful with graceful auburn hair blue eyes and black eyelashes a pretty nose kissable lips pretty ears and pretty breast and a graceful carriage with long arms and legs and a broad pelvis, and very pretty teeth ear rings and jewelry fitted her very well. There was a fort like Morro castle in La Habana and there were pretty sunsets blue and grey seas and white trade cumulus clouds in Cartagena lagoon at night. It was altogether a very pleasing picture. I sweated and cussed roundly at the typewriter today as I banged out my report.

July 22 - Airplane trip postponed to Monday. Dusty sky today but almost no wind, quite hot. I went to the movies again tonight finished work wrote letters to aunt Katherine and the A.F.S.C.

July 23 - Clearer today and hot. I went out to the Palestine for the day. The sky became dusty again and there was a light north west wind. With Ahmed's help I straightened out the fishes collected in my absence including a new species of grouper, and wrapped and labeled them. In the early afternoon I ran a short poison station by the fish pier rocks I got a few small fish and 8 interesting blennies. I am still pretty weak on my pins and tire easily. I mailed a color film today, and letters to Elsie & Lucile. I ate lunch about 4 P.M. And I ran a sailor's

Report to Schultz July 21, letter Chase: July 23

125

needle thru my arm while fixing a sandal. I went to the movies tonight. July 24 - Clearer and hot today with little wind. I mailed a letter to Lucile ate breakfast, and went to see K.O. Feltman to get the ball rolling. He got me to call Dr. Johnson in Marathon to arrange my airplane trips home around Aug 10<sup>th</sup> which he said he would do. Then we went to the clinic to see the doctor about physical exams, etc. I then went to Mr. Sanders to arrange for shipping my boxes back to the states which he said could be done and shipped in two months, he also filled out a shop order for me for two wooden boxes and noise and reinforce lid on one of my old boxes which I took to Mr. Hutchinson's office at the refinery. I will have to give him an idea of the sizes needed. I put the order in for 2 boxes 40"-30"-24" and reinforce lid on #19. I went down and loaded on 4 boxes from the fish pier (3 were fish) and one net and took them up to the storage house this afternoon. I also got my heavy rubber gloves.

I went fishing tonight off the end of the fish pier tonight with the hoop net. I caught only a few small fish scorpaenids, dussumieriids, and gerrids & red shrimp. I saw a few gut gabs but no snakes. There were a lot of one foot gars and silversides. I weigh only 155 lbs. and came over at 180 lbs., and I am still pretty weak on my pins. I sure will be glad to get back to the states. There were clouds in the sky this afternoon, small cumulus, and early this evening. It was hot during the first part of the night.

July 25 I went to Dhabran today. I typed up most of my museum box inventory this morning. I took the bus to Dhabran from 11:30 to 12:40 crawling and bumping along over

over the desert blast furnace. I deposited my gear at the club house, got my banking accounts which including the dastardly arab duty of \$30 (damn them), and also got some help from Joe Martin which he had saved for Ahmed for me. I slept and read during the afternoon. I attended the Dahrain fishing club meeting at 7:00 P.M. and they carried on business with Mr. Weber, v.p., presiding apparently they were getting a trolling boat from Bahrain. I delivered my talk at 8 P.M. to about 60 people and boys. I talked till about 8:45 P.M. ten questions and then I showed ten specimens. Many Leonardini seemed quite satisfied and Mr. Adler so I guess it went over alright, and the young boys asked quite a few questions.

July 26 - Perfect weather clear sky, clear vision, no wind, and no airplane trips!!! This is the fourth time it has been called off for no good reason at all; I believe they never had any intentions of making good on their promise. I am thoroughly washed up with the whole damn outfit and wish I had asked to go home Aug. 1st instead of Aug. 10th. Also Garley doesn't think we will make Jez Jenal before the 10th, well I just don't give a damn. If I can find that porpoise and shark skeleton on Chasahouse Island in the next day or two I will be satisfied. They won't fix the row boat, make oarlocks, keep the boat supplied, check the radio, or fix the charge motor; just nothing gets done. Mr. Teltman helped me check out at the carpenter shop about my boxes and they will start when I bring in the old box. We also went out to the plant and I wrapped the fish collection. This afternoon I sounded out my last night's talk on the typewriter 4 pages

and 4 copies. I also started the other day my book invoice. I got one letter from Suile this morning and 2 this afternoon, and she had only received 2 letters from Jidda at that time, July 17. I went to the movies tonight and saw the Bachelor and the Bobby-soxer (Cary Grant, Ingrid Bergman and Shirley Temple who is a very pretty young lady now). At one disgusted moment Cary Grant was pushing his trunk to fly to Africa and then he told the older man near him and then may be Arabia. The older man said "I think you are making a great mistake" and that of course brought the house down, it was so apropos.

July 27 - Fair, hot, and hazy today. I got my box of Jidda fish hauled over to the carpenter shop to raise the lid higher; I also got my tank of formalin from the boat, and headed for Dahrain on the 1:30 bus. We made it in 1 hour and 5 minutes a record for me. I drove the last half because the arab almost fell asleep driving. I got the same room for housing, and paid my camera duty at the bank in ruppees. Then I went to see Jim Stewart to check over my list of additional fish names from the Persian Gulf. I also noted a saw from a sawfish which was given to George Bentz from an Arab at Al Khobar. It was 4 1/2 inches long with 32 teeth on each side. He also had a 5 inch ostrich egg from the desert. He also had a record of an ostrich being shot near Trans-Jordan. I never even knew there were ostriches in the Arabian desert. I also met Joe Smith from Hofuf who seems to be a nice fellow and is starting an agricultural experiment in Hofuf the biggest oasis and date gardens in Arabia. He wants me to look over the local fresh water fish situation. We will leave the day after tomorrow at 7 A.M. by car. It is about 80 miles quite a ride! But it sounds interesting. Our everlasting post

128 July 27 2nd letter to Fuile

poned airplane trips over the Gulf and outlying island is supposed to come off tomorrow, in sha Allah!! I sent a copy of my Jidda fish names by mail to Jan Stewart. I also mailed another letter to Fuile. I went to the movies tonight as usual and saw "Repeat Performance" about an actress who lived a year of her life over again. It was not exactly a pleasant story but it was well acted.

July 28 - Thick seat haze this morning with the sun a dull silver. Visibility between  $\frac{1}{4}$  &  $\frac{1}{2}$  mile light only 25 on my meter. I met Ed at 7:30 A.M. and we left for the airport and as I had rather expected the flight was cancelled because of weather. I went to see George Renty this morning and got 4 photos of the saw fish saw; also a little one 9 inches long with 36 teeth on the left side and 35 teeth on the right side; the smaller one may be a different species.

About 10 A.M. Ed and I headed down to Al Khobar and south along the beach to El Azizia. I walked a  $\frac{1}{4}$  of a mile along the water's edge and there was some brown sea weed and numerous wind rows of thin reef grass or rather sand grass along the water's edge. The sky was hazy and a fair breeze from the north and the tide was just about flood and the water was surprisingly cool. I got quite a collection of shells including crab shells and also about 20 shark vertebrae spread out along the shore over quite a distance. With a 10 ft. minnow seine Ed and I caught some small Sillago, some very good and large Cyprinodon dispar, some small mullets, and one small Terapon jarbua. Also we were privileged to see quite a bit of bird life along the shore: large brown plovers with black bills, large black billed curlews, one sandpiper,

Birds July 28 letter to Fuile

Birds

129

several killdeer like & ringed plovers, one oyster catcher (black & white), several white gulls like herring gulls, several black headed gulls like Bonaparte gulls, numerous small black capped terns, a large black billed sandpiper (possibly a plover because of short neck, but it was spotted grey and white with black spot), a large crow (possibly a raven), and a large flock of about 30 long legged short billed, short necked light brown with lower wings black & belly whitish sandpipers (which did not look exactly like sandpipers). They were about the size of the lesser yellow legs. I collected some sea weed as well as fish & shells, and the trip was quite a success. The sun became hotter, brighter, and more glaring as noon came on. The meat sandwiches we had were not appetizing, so when I came back to lunch all I could manage was apple salad, cake, & ice tea. Ed went back to Ras Tanura in the afternoon. I think it well to mention here the numerous brown pigeons with black and white tails and the brown horned larks (about robin sized) that one sees often around Qatif on the road from Ras Tanura to Dharan. I went to see Mr. Bier about the plane home, but he was out of town today.

I went to the movies tonight and saw Bob Hope and Dorothy Lamour, Peter Lorre, and Bing Crosby in the last scene. It was a murder picture but was full of laughs from Bob Hope's wonderful humor. I am a complete movie addict over here now.

July 29 - Joe Smith, Dick Daggy, and I left for Hofuf from Dharan at 7:30 A.M. We reached Abqaiq at 9:00 A.M. and had a second breakfast. Abqaiq is quite desolate with very little greenery and is quite a bit smaller than Dharan or Ras Tanura. Between Abqaiq and Hofuf we passed numerous oases and wells and camels and a series of Jebels on our right. I saw a large tan pigeon, called a gutter bird, and also the single

large crested larks, and also several Halcyon martins by a well. In the wells and springs we saw numerous large and small Cyprinodon dixius and frogs. In one small oasis, we heard and saw numerous cicadas on the palm trees. Tich got hold of one specimen. They sound the same as the ones in the states and about the same size. We arrived about 12:15 at our native house in Kofhuf. The streets are all <sup>quite wide</sup> road and the houses built of white mud. The trip was about 90 miles and was not bad. In one spring pond I saw a red dragonfly, notonectids, whirligig beetles, and giant water beetles brownish in color. In some ponds there is blue green algae as there was in this. In others is bright green filamentous Spirogyra like algae, and other thick tan green scum algae. We were going to see the Emir at 4 P.M.; it turned out we did not go till 10:45 P.M. Benji-Louie sounds like part of his name. He is Emir of al Khara and signed the letter for the Palestine. He looks about 45 and is fairly stout. He was quite and soft spoken but had humor; we just sort of explained our presence and business in mind which he already knew, but we did for courtesy. We stayed about 15 minutes or so then a round of coffee and tea. His guards were well supplied with swords in silver scabbards, and there were a few guns around. His throne was a sea blue with some decorations and there were simple sofas along side. He did not express optimism for larger fish which is a good sign, but was not against the idea. We slept out on the roof under the stars which was quite cool.

July 30 - We slept under mosquito nets and in the morning Tich got a good collection of small sand flies (the bad kind), numerous culex mosquitoes including one male, and one female Anopheles. This morning we went out in the field at 7:30 A.M.

with Sheik Rashed as our guide, and Mohammed bin Salim as our interpreter. Outside the near by town of Al Jaffur there was a small deep well, and a few small puddles where water had probably spilled and there was some green algae and they were full of small Anopheles larvae. From there we went to see the wells and springs ("ain") in the various date gardens. We also went to see the large lake "Asfer" which was entirely dry but was thick with small green vegetation bushes sedge grass etc. Then we went to see the large "ain's" of El Khadood and Al Hagul. El Khadood was the most interesting and the larger of the two at the head end was close to 50 ft. deep of clear water. There were also numerous rice pattys with about 3 or 4 inches of water. There were numerous grey frogs and also grey frogs with black spots. In one deep pond there was a brown and white flat stellled turtle about 10", and later in the day I saw a black painted turtle. There were a couple of large species of water beetles and I got them. I also saw quite a number of 3 inch mullet (Cheles), but we could not catch them. We had one in the net a couple of times and they cleared the top line by jumping over. I thought I saw some Gambusia like fish on the surface of the turtle ponds, but they were probably C. dixius. Some of the killies are enormous and they are all rather darker in color than specimens from salt water. In one date garden I saw a small shrike like bird with a grey back and reddish brown large tail; also a smaller green sized bird grey with a black tail (also large). I saw a glimpse of highly colored light blue iridescent bird which they said might have been a kingfisher. It was about that size. In the early afternoon, we went to Jebel Gara a large

Hill of reddish tan rocks of clayey substance. There was a long cave in one side which was  $77^{\circ}\text{F}$  inside and the outside air temperature was  $117^{\circ}\text{F}$ . We slept for awhile in the cave for a couple of hours. It was almost too cold for me. There were small silver wing bats flitting around the cave was not very dark. The sky light hole was about 110 feet above us, and let in a little sunlight. In the sand outside the temperature was  $50^{\circ}\text{C}$ . I lost both my thermometers today, one in the morning and one in the afternoon!!!

Before lunch we visited the Sheikhs house for a game of Kairam a pool like game with checkers. We also had some of the kings fresh dates, and they were good. They are put up in 2 qt. boxes made of palm branch wood. In Mohameds family garden there were peach trees, figs, citrons, red dates, and yellow dates, and a nut like tree that produces the "Sim" berry used for fish poison. The trees had a 3 inch trunk like a walnut the leaves were pinnately compound. The berries were like small green grapes. When we got back to the house at 7 P.M. we were bushed. But Dick and Joe were heroic and when back with me at 10 P.M. to El Khadood, and we saw another brown and white turtle, and saw and heard plenty of frogs croaking they sounded most like leopard frogs. I caught one male grey one with black spots. We saw less mullet than in the day time and they were not near shore; so we did not seine. There were a few clouds in the sky before sunset. The weather was clear. The boys beat on tin drums a good part of the night and sang in sort of a whine, then there is the prayer caller who sounds like he is straining his voice. And then there was the gun that went off, and it was also hot.

7/31 letter to Juile  
re: plane leaving Aug. 8

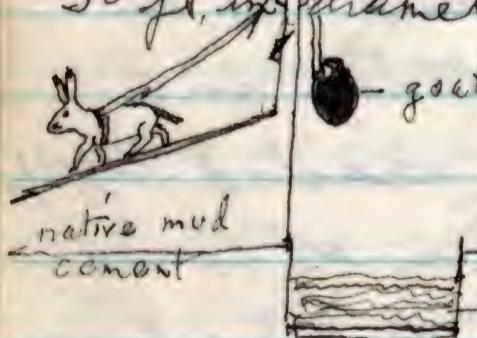

July 31 - Today was fairly clear, and the three of us left for Shabran about 7:30 A.M. We got there about 11:30, and had stopped for a second breakfast at Abqaig. Mr. Johnson approved my getting a pickup to collect in Hofuf. I saw Ed Guiley and he had two letters one from Hussein and one from Nat from Bermuda. I had a most miserable rough and hot trip to Ras Tanura from 12 to 1. There was no mail for me in Ras Tanura; they never sorted any mail for two days, that's the pay off. I got the poison from the boat and a dip net, and found out my plane the Gazelle, leaves Aug. 8<sup>th</sup>, which sooner than I thought but I am inwardly glad. I got back to Shabran at 4:40, and Mr. Bier did not have my ration book but had it for me in the morning. Below the mess hall I saw a black and white woodpecker about the same size and color as the red bellied woodpecker. Its head was black and tail black. The tail was shortish and the bill long and it flew the jerky flight of woodpeckers. We visited the Rantzei tree Duggy before supper. Jim Stewart went me to take a watch to his wife in New York. We went to the movies tonight and saw "desert fury" with good color but little else.

Aug 1 - Joe and I did not get away till about 9:45 A.M. So I had to get my pick up at 5:45. We had a long talk with Mr. Johnson. It was 64 Km. to Abqaig and 72 Km. to Hofuf. It was a rough trip for my yesterdays sore back. We ate lunch at abqaig at 11:30 and reached Hofuf about 2:30 P.M. It was bushed it was about  $110^{\circ}\text{F}$  in the house. I wrote several letters. At 5:30 P.M., Abdullah the house boy and I went to El Khadood. I used about 3 qts. of rope none. The blow was fast and carried the cloud away quickly.

and for 2 or 3 minutes it seemed nothing appeared, and I thought it was a failure. Then a number of mullet started striking the surface and acted crazy and even went up in a narrow small canal, so I picked up over a dozen 2 - 3 inches long. There were a lot of kids around who were a damn nuisance so I did not hang around long. The killies were also hit but it seemed to me that they were not as easily affected as the mullet, and very few large killies were hurt at all. Frogs were all over the place on the grass and they were eating small killies by the dozens. It was hot tonight and they drove a noisy truck back and forth near the house for an hour or so. Then the drum beaters started in again about 4 hours later, only they were louder and more of them this time.

Aug 2 - Cool at dawn and about  $2\frac{1}{2}$  hrs. afterwards when it was  $88^{\circ}\text{F}$  air temperature in the date gardens. It was hazy early in the morning with the sun a silver ball, but it cleared up later on. Abdulla Atif helped me again as my guide to the different ains. The three new ains we visited were all about N.E. of ain Khadood. In fact we passed over the stream part of El Khadood further east.

The first ain we stopped at was Al Jeffur. It was a small ain with a small flow of water it was about 18 ft. deep and 50 ft. in diameter and was almost round. There was a donkey goat skin irrigation well near by which I have illustrated because there was not enough light to take a picture. I used the dip net and caught a frog, a painted turtle, several killies, water striders, and stinging water bugs and a straight spiral tiny snail which is not good news but there were

mostly curved spiral snails with thin shells. Frogs were abundant, and there was abundant dark green rooted *chara* like weed but no grass. The water was not as clear as most ains and there were apparently no mullet here. The donkeys that work hauling irrigation water are covered with old scars and fresh open sores and cuts and look in pretty rough shape. The rope and sweat probably cuts into the hide. The next ain off a little further N.E. was another long ain with a deep round spring at the head end like El Khadood and a stream of fair size going east from it, and a small stream going west, thus it overflowed in two opposite directions. The water temperature at Jeffur was  $87^{\circ}\text{F}$  and  $1\frac{1}{2}$  hours later I got almost  $89^{\circ}$  at ain Fray Henna. Frayhenna is similar to El Khadood but is smaller. In the spring I got a reading of 30 ft. There were apparently mullet present, so I mixed the usual 3 gals. of poison and laid it deep in the middle of one side of the ain. It tended to drift towards the smaller outlet but slowly. It soon dispersed and within 2 minutes there were mullet rushing around the surface all over the place almost jumping out on the bank upon the grass at the water's edge. It was quite a while before the killies were affected in mass, but when they were it hit them hard. Dead fish drifted as much as 500 yds down the big stream a few jumped into the entrance of the little stream some sank in the spring. Numerous fish were not recovered because a good collection had been made. I also got a couple of black leeches with red lined sides. In the house in the early morning I caught a small lizard

Hofuf letters Aug. 3 - Lucile, Larry, Roz, Nat, Polks, Dr. Hora,  
2 to Dr. Schultz

"Muthis"

and a beetle. The next aïn we visited was more or less north, and was situated in front of a two story good looking Arab house, there were numerous rice paties around probably fed from this spring. And there were also some palms. It was large and square bordered by native cement. It was about 100 feet square. It was possibly 40 feet at its deepest part and root chara was growing at a depth of 25 ft. It was crystal clear water was a pretty blue color. I only took pictures here. There were no readily visible outlets but I presume there were some. I saw a few killies but no mullet. Because of all the frogs around my mind turned to the idea of bull frogs, for frog farming. This was the last aïn I visited, and we returned for lunch. I made quite a collection of pond weeds. All these three aïns were in the same series of date gardens and were not separated by desert. At 3:30 P.M. the temperature inside the house was  $108^{\circ}\text{F}$  and outside on the concrete in the sun  $131^{\circ}\text{F}$ . air temperature in sun  $113^{\circ}\text{F}$ . This afternoon, I wrote a letter to Dr. Hora and wrote notes and wrapped specimens and helped the boys move their generator motor unit into place which was a job; then it was 7 P.M. Buck and Joe finally got the generator working and we had lights tonite, what a luxury! I worked on letters till 11:15 P.M.

Aug. 3 - The drummers got busy on the drums and singing last nite; I rather had hoped I would sleep thru them, but I didn't. Then some guys started playing a tattoo with a stick on a camel and the camels groaned, and I didn't sleep much after that. The generator plant ran well all nite. We got up at 6 A.M. again when it is still dark, and had breakfast. This morning I

In the date gardens I saw a bluish skink lizard with black and yellow stripes 137 on the back (about 8" long including tail) not far from 'ain Khadid.

wrote my Hofuf report of my findings and recommended the introduction of carps, and a later experimental introduction of bull frogs. I also, at Joe's suggestion, drew up a short sub report on the possibilities of static production of sardine fish meal and fish oil, and the use of trash fish and fish carcasses as man fertilizer. About 9:30 A.M. Joe and I headed for the date gardens and went far in to the east end fished in one of the eastern branches of Al Khadid. Joe wanted to look at some of the rice paties he is going to plough this fall. I was quite surprised to find mullet in small stream pools in two places. They are wider spread than I had thought. I used three quarts of poison above a pool just below a road culvert the pool was about 10 feet across 15 feet long and 5 feet in its deepest part. Water grass was very thick all over the stream above the culvert; it was only on the sides below. The temperature of the water was  $86^{\circ}\text{F}$ . There was also another hard chara like weed in one place close to the bank, and I collected some. There were hundreds of whirligig beetles, and a few water boatmen, etc.

This afternoon, Buck Tongerty and I left for Dharan which we reached at 6:30 P.M. and we stopped off at Abqaiq as usual for a rest. I ate in Dharan and reached Ras Tanura about 8 P.M. and had some good mail waiting for me. I showed Ed my report, and we talked quite a bit about the survey till about 12 P.M. He showed me his report on the second air trip, and says he saw more pelagic fish than in Ranch.

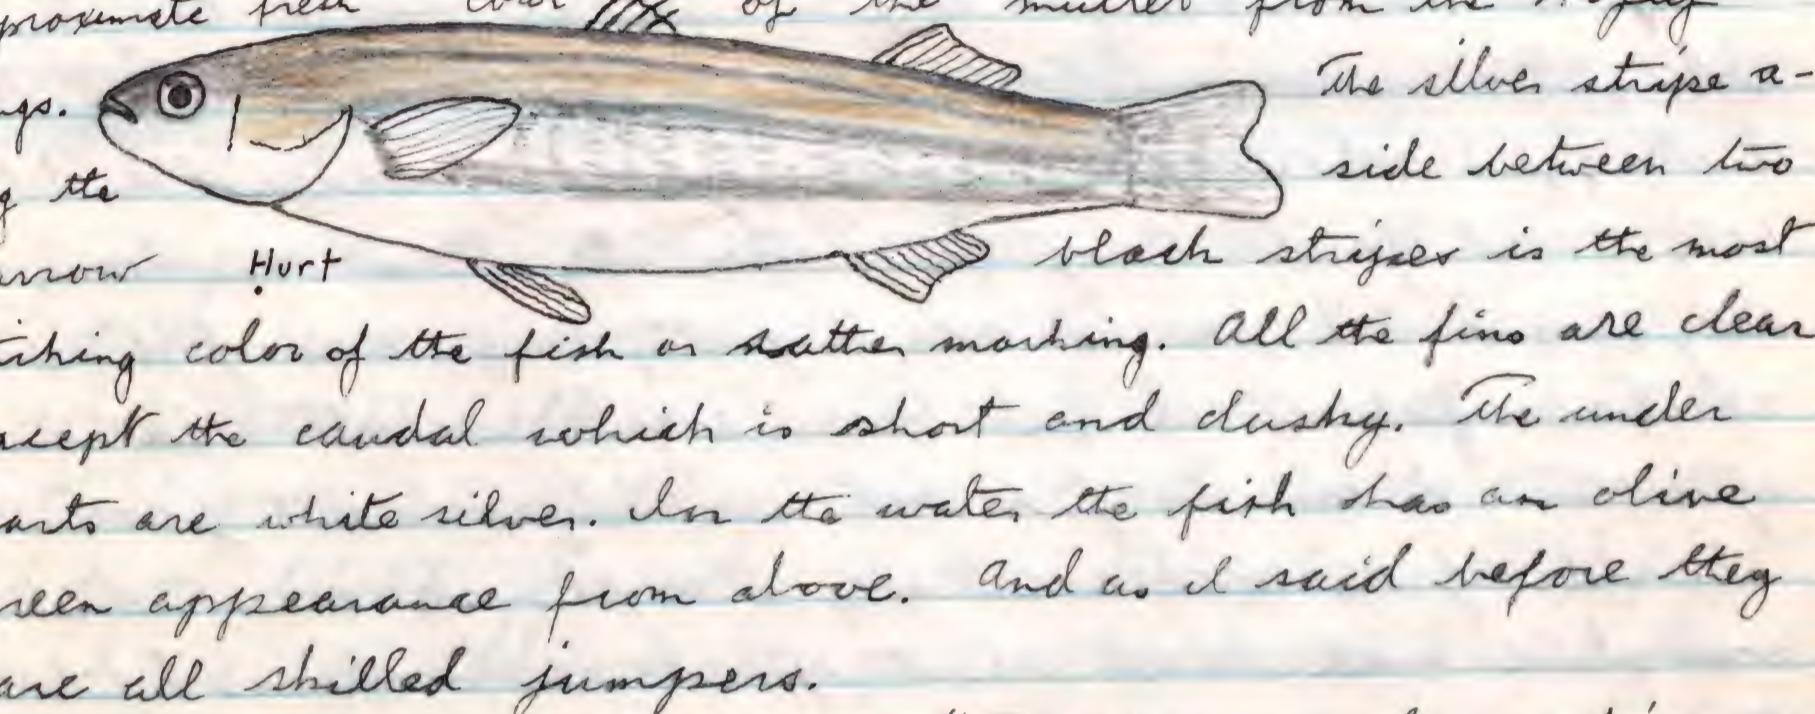

Aug. 4 - I got up at 5:45 A.M. got my pack up, had breakfast, and went out to pick up my stuff from the Palestine

I weighed 162 on the fish scales. Ahmed had some fresh 'cut' for me. My boxes were made up in the carpenter shop. And I had quite a bit of hauling to do and unloading and loading. Ed helped me out. We left for Shabran about 12:45 and reached it about 2:15 P.M. I took my stuff (2 boxes) to the storehouse to hold for loading on the plane. I saw Mr. Bir, Cooper, Daggy, Dr. J. de Lougherty, Jim Stewart etc. I am to have my physical exam in Shabran Saturday. I saw a crow today which was a lot smaller than the raven Ed and I saw at El Azzizia, but it (the one I saw on the Ras Tanura road) was regular crow size. Ed and I got back from Shabran about 9:30 and were in bed dead tired at 10:15.

Aug. 5 - Up at 6 A.M. this morning but no trucks. I spent all morning wrapping and packaging specimens, but I finally got done; and am ready to go to the storehouse this afternoon. I borrowed Mr. Telmissani's truck and nearly died from sweating in that back storehouse, it was enough to drive you crazy. I knocked open the barrel and there was only a gasoline stink; all the fish were rusty. I discarded about 10 fish including one large mackerel, the large stadi, a small hamoor, the large barracuda, a puffer, a *Lethrinus nebulosus*, the large puffer, a couple of parrotfish, and one or two mackerel scales. The rest I saved and filled out my 8 gal. tank. I hope they do not discolor the other specimens. I got thru about 4 P.M. and then went back to the house for a shower rested 1 1/2 hours. Typed the Hofuf report till 7:30, had supper, a haircut, and finished the report 11:15 P.M. and I was very tired, and I will be glad not to do any reports for awhile. I saved out box #16 with 16 gal. tank of rotenone for Ed Burley, also gave him hypodermic

~~Aug. 6~~ syringe, 3 hypodermic needles, barrel of formalin  $\frac{2}{3}$  full, 1 25' minnow seine, 1 6 ft. minnow seine, 1 spool linen thread, tin tags, 3 regular wt curved needles, 1 fish gig, 2 eel pots.

Aug 6 - I got to bed about 1 A.M. last night but slept well and got up at 8:45 A.M. and had breakfast. Below is the approximate body color ~~of~~ of the mullet from the Hofuf springs.

The silver stripe a-side between two black stripes is the most striking color of the fish or scatter marking. All the fins are clear except the caudal which is short and dusky. The under parts are white silver. In the water the fish has an olive green appearance from above. And as I said before they are all skilled jumpers.

at 11:30 A.M., Ed told me the "Tareet" was ready anytime, so I went over and got a bag lunch to take along. I got out to the fish pier about noon, and man out to get the row boat which was half full of water. There is still only one oar lock, the two ordered several months ago never appeared. The bottom of the Palestine looks like a forest from sitting around the pier so long. All these signs hardly make me regret that I am leaving A.R.A.M.C.O. Saif engineer and a new Abdulla from the "Palestine" were the crew. Incidentally 4 abdullas have been crew on the "Palestine." We left ~~the~~ fish pier about 12:30 and returned about 8:00 P.M. shortly before sundown. Our course was mostly south by east from Ras Tanura. There was a light northerly wind when we left, and the Gulf was calm, but by the time we passed abeam the new Damman pier the wind increased N by W to small

140 we saw a dead abelonee hins floating when we cast anchor south of Charchuse Id.

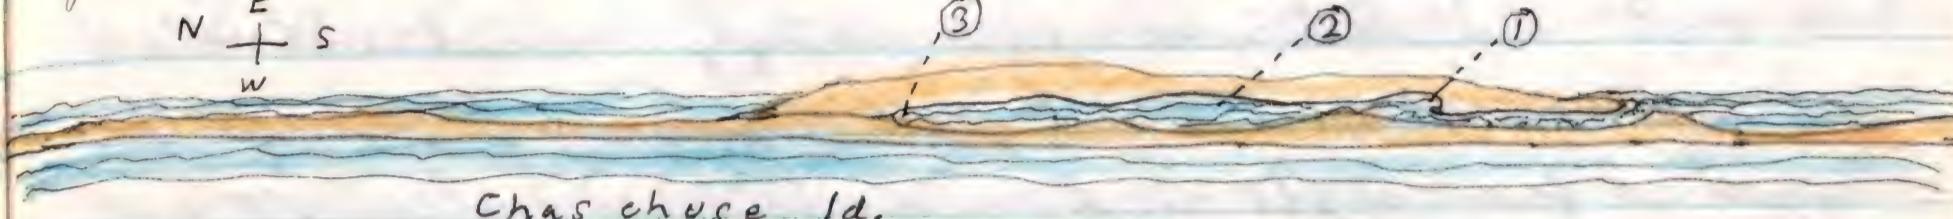

white caps. The wind was even a little stronger on the return trip, and was quite wet. There were quite a few small high cumulus and cirrus clouds in the sky. There was a distant haze but visibility was good a couple of miles or more.

The tide was ebbing and near dead low at Ras Tanura at noon. It was starting to come in when we reached Charchuse Id. We anchored off the west side of Charchuse Id. and I struggled ashore paddling the rowboat; of course I had to bail it out first. Being Rhamadan sto. I had the crew stay aboard. I passed over a pretty large area of live coral; staghorn coral and brain coral in about a fathom of water. I saw no fish but visibility was not good.

Inside of the coral area was a coral rock area which was alive with black short-spined sea urchins. I did not tarry for them, however, because I had business ashore. The last 200 yds. or so was sand bottom from 2 to 3 feet deep. There were about 30 cormorants sitting on the sand beach and they took off a bit when I arrived on shore. I went over to the east side where we anchored once with the "Palestine" when the water is deeper a lot closer to shore, but more right be some coral rock bottom there also. I saw a group of coral rocks sticking out from shore, and there was a whole flock of terns about 50 (the white & dusky ones) and one oyster catcher.

On the way to Charchuse we passed a single mast dhow with a pointed stern and a crew of about 20. Saif said it was a Burmese boat, and is called a "farsi." I looked for the proprie skeleton along both shores in vicinity of the inland pond, but being the island is at least a mile long at low tide, I decided to forego racing all over the beach. The air temperature in the boat cabin while running was 38°C, 39°C in the sun outside the cabin, 48°C

on the deck in the sun. The water temperature just under the surface of the water inshore was 39°C, and also the pond temperature was 39°C. The air temperature was about 40°C in the sun. The island is all bare sand except for about a dozen or so widely scattered small glasswort like plants. A few minutes later I saw 3 oyster catchers

Charchuse Id.

flying along with their distinctive single whistle note. The above illustration shows the approximate position and relative size of the ponds of Charchuse Id. The ponds empty to the south and out the east end of the island. They are also situated towards the southern end of the island. The bottom of the inland ponds varied from sand where the tide was strongest to mud sand where the tide was not so strong in the ponds. At low tide the deepest part of the ponds might have been 5 ft., but it was hard to tell by looking. There were 2 real connected ponds of roughly 200 feet in diameter. The only vegetation was a green scum algal. The tide continued to go out of the ponds at least a half hour after the tide started to come in. This was the case when I arrived. I probed 2 places on a little side pool with a narrow connection to the main stream at the south end, and pond no. 2 near the center, and one small willow in the far reaches of the upper end in about a 1/2 inch of water.

At the waters edge of the north pond I saw 2 large sandpipers one looked very much like a ♂ turnstone with the black throat and brown back, the other was probably a ♀.

On the high part of the beach just west of the ponds I saw about the weirdest bird I ever laid eyes on. Because it teetered a couple of times I imagine it was a sandgrouse; it was slightly

Aug 7 and Taggy. letter to Mary Leonardine

nested a while till the boards got too hard. There were about 12  
freighters around east pier. The tide was about flood when we  
reached the fish pier. I stayed up late getting things ready  
and packed up.

Aug 7 - Up at 6 A.M. got things in order, and stopped  
by Teltman's office to give him two copies of my inventory  
for the equipment, and I met up with a fellow, Jim Daniels - who  
is going to Shabwan, but even he had his troubles getting  
transportation. Dan finally got an ideal car, a coupe with  
a truck back, and we arrived in Shabwan at 10:30 A.M.  
and I got Jim's watch to take to his wife, and found  
out that my plane was leaving Aug. 9<sup>th</sup> instead of Aug 8<sup>th</sup>.  
I dropped a lot of bottles off with Taggy, and they wanted  
me (Mrs. Crawford to look up Paul Oman for the museum). I  
finally got my 3 rupees back from the Aug. 1, breakfast  
I paid for. It was quite an involved procedure. I  
had good luck getting my boxes from the storehouse  
by taxi, and am back again at 14:11. Later I talked  
with Mr. Savage and later Mr. Duncan on my ideas  
of the fishing problems. I told them I thought the  
outlook was very encouraging as regards the fish  
supply. I took my physical exam about 5 P.M.  
and I was O.K. and now weigh 165 lbs. 320 den  
gaining steadily. I used up my 25 rupees buying  
5 T shirts, because I would have trouble getting dollars  
for them. Jim gave me his corrected list of Arabic  
fish names, and he had found out quite a bit.

This evening, I saw Abbott and Costello in the "Widow of  
Willow Keys" which was quite amazing the cliff crack being marriage  
is a 3 ring circus; an engagement ring, wedding ring, and suffering.

hoopoe

smaller than a killdeer (but there the resemblance ends). The bill  
was long and black and the flat narrow crest was exactly para-  
llel with it sort of like a shoe maker's hammer.

The bill also curved slightly downwards. The head  
and underparts were a tan sand color the wings  
guess who? and tail were white strongly barred with black  
the feet were black and not particularly long. The crest dis-  
appeared from sight in a miraculous way in flight, sort  
of the way herons especially the "quacks" lose their necks  
in flight. From then on I ignored birds. There were some  
cat's eye snails and <sup>the</sup> other ones in the rocks on the east  
side (already mentioned) and some of those purple black crabs.

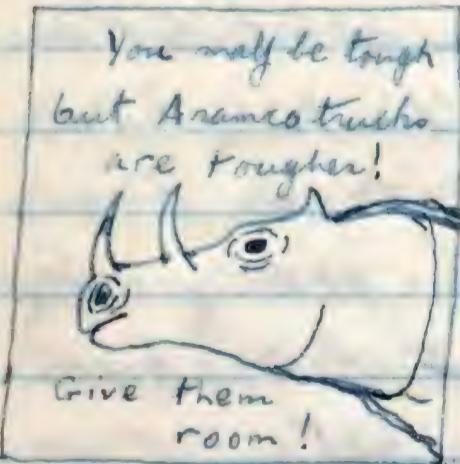

In area ① I used a half gallon of rotenone, and  
recovered 2 Platycephalus, numerous mullet, Sillago,  
Hemiramphus, Sparus dattina, and a couple of Tetragonopterus.  
In area ② the center of the pond was dark in color I thought  
it was bottom grass, but when it moved en masse I saw  
it was solid atherinids both the white finned and black  
finned varieties. There were also numerous mullet, some  
suffi, sparus dattina, gerrids, a few small Largos noct. Some  
larger fish were cutting the school up, and I had a glimpse of  
one about 10 inches long and it looked like a grey snapper  
but might have been an S. curvieri. The atherinids really  
took a beating from the poison, and were along the beach  
for quite a ways they were all medium size  $1\frac{1}{2}$  -  $2\frac{1}{2}$  inches.  
The mullet reached possibly 4 inches. I packed all the fish in  
what I could into two small bottles and left. I cursed and  
sweated all the way out in the row boat using the net  
handle as an extra oar lock. Saif had started the motor  
up which helped and we got off back to Ras Tumra. I

Aug 8 - I had the runs last night after sort of a stomach ache, so my sleep was rather interrupted. But I managed to stay more or less unconscious until 9:15 A.M. Teltman called yesterday to say there was a lot of mail for me and he would try to send it down, or I could come up for it. I don't think I am in the mood to go up for it. I worked all morning copying down a list of converted scientific, English, and Arab names for the Persian Gulf.

This afternoon there was still no mail so I went up to Ras Tanura and saw Teltman and he said he had sent it down; so I went back again, and still no mail. So I went to see Joe Heftner and he said they had the motor out of the "Gazelle" and the plane would not leave tomorrow. Later he came around with the mail which deereed me up a bit. Vic came in for a talk later about snakes, etc., and that raised the time till 8:25 P.M., and I just squeezed under the soap for supper. I went to bed early.

Aug 9 - I got up late and it was fair and sunny and I feel better today than yesterday. They had a safety poster contest yesterday, but only one appealed to me. It was the only one that hit the real point, and was really original. I did not vote, however, as I am not a regular employee. The others were all similar and sort of the polygonal type, about what a good thing safety is etc. This morning, I went to see Jim to get some correction on the fish name list, and I copied the list back into my log again; so when questions arise I can easily check back.

I got my fish name list pretty well collected and

back into my log. I left a copy with Jim Stewart with my corresponding numbers. I also checked Maj. Lane and Bleigeld for name similarities with theirs and my names, and entered them on pp. 168-169.

I talked with Mr. Edwards, Jr. from Al Kharj today at lunch and he gave me some interesting information on the springs or "ain" at al Kharj. He says they are not very wide but are very deep as much as 70 feet (?) but they are in the open without shade and apparently almost no vegetation and the sides fall off towards the bottom in ledges. He did not say that there were any fish there, but from what he said the prospects do not sound favorable there at all. He also said he knew C. B. Nelson at Jidda, who had attempted to set up a shark industry in the Red Sea, and he told me where I might find out his address in the states. I think Dr. Hildebrand knows Mr. Nelson. It seemed hot again today, but may be I am getting soft from the air conditioning.

I saw Joe again today and the prospects for departure tomorrow of the "Gazelle" do not look good, but he said if it does leave he will let me know by 5 P.M. I guess my luck just isn't good. The bad news came again, the plane will not leave tomorrow. I wrote a short bit on arat name similarity.

This evening, I went to the movies as usual and saw "The Miracle on 34th St" with beautiful Maureen O'Hara and John Payne. It was centered around Macy's Xmas parade and a true Santa Claus.

Aug 10 - I had the runs a bit last night, so I got some paragone & pills at the clinic. Then I went to the library when it opened and read most of "The Stereograph" by Julia Davis which was an interesting and detailed history of this beautiful section of Virginia, which is really not far from our present home.

This afternoon I read some more of "The Shenandoah" and also a story by Dickens centered around "Belize" an island off British Honduras. The title was "The Hardships of certain English prisoners" or something similar. I found out the bad news again tonight that now the "Gazelle" is expected to leave Thursday so I am doomed another day in Shabran. I met Si for her tonight and he was very friendly and seems to have a real understanding of a scientist's frame of mind.

I played up 2 or 3 games of chess this evening in the club house which helped to pass the time pleasantly.

Aug. 11 - Article on similar fish names sent to "Sun and Flare." I feel better today, and rumors still persist that the "Gazelle" is going to leave tomorrow. I went to the library this morning and read short stories, and attended the morning movies. In the afternoon, I continued reading short stories. At 4:30 P.M. I found out the unbelievably good news that "the Gazelle" is leaving tomorrow. That is the best news I have heard for 5 months. That means we ought to get to New York Sunday, I hope. I guess I would never quite have realized how much I would miss Lucile till these 5 months; but now it is good to be homeward bound. Ed Gurley came down to Shabran tonight.

Aug. 12 - Sometime early this morning an Indian or Arab stuck his head in the door (it later turned out to be 3:15 A.M.) and I of course assumed he was my chauffeur. I would have been completely convinced I was "sand happy" if Ed had not also seen and responded to this same opposition. At any rate we carried out the bags after getting dressed and there was no Arab or pick up insight. So Ed went down to the car pool to get his car, and I phoned the pool meanwhile

and found out that it was 3:30 A.M. and they guy was convinced that I was seeing things. Ed came back afterwards while with his car and said rumors were that the "Gazelle" might not even leave. So I showed him my latest notes, and then we went and had breakfast around 4:15 A.M. We decided back at the car pool around 5 A.M., and theateful news that the "Gazelle's" flight was postponed indefinitely was reconfirmed; so we went back to bed. I got up again about 8:30 (?) and called Joe and he confirmed the news and said they would try to get me out some other way, but that my equipment might present a problem, at any rate none could be found out later. To say that this is a disappointment to me would not only be an understatement but rather an anti-climax.

I spent the whole morning in an office reading short histories of aviation states awaiting the verdict on my fate. My two bags are to be shipped over and if a contractor is obtained for the "Gazelle" in the States (15 weeks or more at least). I can leave via Pan-Am. on Friday, Aug. 16th. I started reading this afternoon Mrs. Ralph Riches "We Took to the Woods" which Lucile has just read. This evening, after supper I fell asleep on the bed with the lights on, and I didn't turn them out for the longest time.

Aug. 13 - There was a fairly strong N.W. breeze early this morning and it seemed cool until nearly 10 A.M. I had breakfast around 9 A.M., and then went swimming in the pool for an hour or so. It is nice but rather small, and is best like it was when not crowded. I also talked with the "Camel" pilot, and they explained the Gander route because there are too many head winds crossing directly west to New York.

148 see Taggy for snakes on bat.

149

Then I went to the movies and saw Red Skelton in "Buster of the movies", which was an amusing comedy. This afternoon, I read more of "We took to the woods" and it is very pleasant and informative reading. This evening, I started composing a vindictive about the Arabian fly.

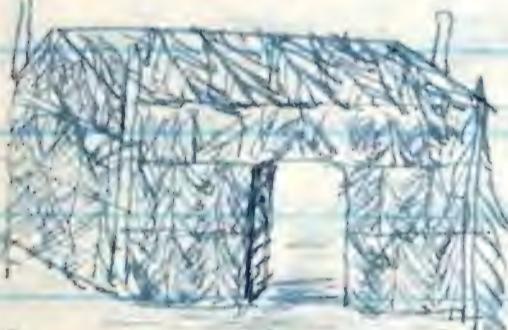

Aug. 14 - Today I took my two boxes to George Jeannette at the new storehouse, and he will take care of them to send them on the "Gazelle" when it goes. It is charged to \$86620, and I think they are in good hands. I made the 8 A.M. bus to Ras Tanura and they are scraping the road and the desert wasn't too hot at that time. I did find my Persian Gulf coast pilot in the boat, and arrived just as Burley was moving to his new room, so I was drafted along with Ahmed. This afternoon, I got interested in "Lover of Life" a novel of a 17<sup>th</sup> century Flemish artist, which used up the afternoon, but I was able to close the book and take the 6 P.M. bus to Shahran. And a very interesting talk with 2 other fellows developed on labor and management and some of the have backs that exist over here. The trip was pleasantly cool; I had more or less sworn that I wasn't going to take any more desert blast furnace trips in the middle of the day. I had a new roommate again tonight.

Aug 15 - Fair and hot today. This morning, I spent over in Taggy's office getting his various specimens plus some films to be mailed to his mother. We also went out to a private lawn to collect some leaf hoppers for Paul Oman at the U.S.N.M. Taggy got hundreds of small ones just by sweeping back and forth with an insect net over the tops of the grass. It took

no sometime to sort them into alcohol vials. I called Joe Heftner then having a personnel and the Pan-Am. is leaving 5 A.M. tomorrow morning. And we are to go for a baggage check 6:30 P.M. today from the mess hall. I am glad we are leaving early tomorrow morning.

This afternoon, I went on a field trip with Taggy and Joe Smith who was in town. Joe was rather surprised to see me! We went as far as the outskirts of Qatif, and stopped at two places near Dammam, and one at Sa'fat on the way. Taggy was after mosquitoes in the local "beauties", and Joe was anxious to meet an Arab in Dammam (or rather in a nice house in a garden nearby). He is an Egyptian, from Cairo and has written a book on Arabian agriculture. The first place we stopped at was a rural home. Taggy disappeared inside to collect mosquitoes. Joe and I looked at a small spring and a date garden nearby and looked at the outdoor bedding. Then on to the Egyptian. The spring we looked at at the first place was 36°C with the air 41°C. Ain "Tawazé" was its name there were some blue greens and no fish. The Egyptian's garden had even roses and other pretty flowers, alfalfa, etc. We left Joe to talk farming, and went on to Sa'fat. While Taggy disappeared after mosquitoes again I took a few pictures and looked around, and found a small pool about 3 feet deep and 4' in diameter. It was full of long spiral snails, 0-48-167, some of which I collected, a few notoectids, and a little blue green, and a lot of brown scum algae. To go back, Taggy and I saw an iridescent bright blue green crow on the fence of Hasein's garden. I am glad Taggy saw it, otherwise, I would have assumed that I was just seeing things.

Beyond Dammam the road was unfamiliar to me. As we approached Qatif we passed a summer Bedouin village in the outskirts with the old Portuguese fort on a small hill in the background. I wished I had saved some film for it, but I had rather wasted it at Sa'fat. We stopped just this side of Qatif and passed a field full of melons, and then went in a gate and back to a native hut with a crew of kids and numerous black goat. It was a typical native palm

hut, and Teggy bent down with his sucking bottle and tube which suction the mosquitoes. There were a few in the darker parts of the room on the palm leaves of the wall just above the floor. He got about 2 dozen and it was 104°F inside even with shade. The road was hardly rain proof. We returned and found Joe had eaten several water melons; Hassan persuaded us to stay, but we had to get back to Dahrain, so I could make the 6:30 bus to the airport. I had time to swallow supper whole in 15 minutes and make the bus, and then out to the airport for customs and to weigh baggage on the plane which took about 2 hours, then back to Dahrain again, to leave for airport at 3:30 A.M., a rugged life! We saw dates drying on the ground.

Aug. 16 - To say that I really slept last night would be an untruth. I tried to drink plenty of water to be sure I had to get up. But as is so often the case water does not have the expected effect here. I only got up twice to phone for the time 1:30 A.M. and 2:27, the second time was just right to make a 3:00 A.M. breakfast, and get on the bus at 3:30 A.M.

Then I left Dahrain for the last time (though I had my doubts for while) without regrets. We were all on the plane at 5:00 A.M. ready to go. One of the two starters pumpers for a carburetor didn't go so there was a 6 and  $\frac{1}{4}$  hour delay until they finally got the thing fixed, and we left at 11:15 A.M. Meanwhile ironically enough the "Gazelle" left at 8 A.M. (I hope with my books aboard). I will not enter into how long was passed; it barely crawled along, and the snakes were hard to sleep on. There is mostly just sand between Dahrain and Damascus. We arrived at Damascus about 3 P.M. There are many beautiful gardens and cultivated fields in the area of Damascus with numerous trees but all apparently planted. I saw a large buzzard like bird tan in color with black and white wings. There were also English sparrows, and the crested larks like the ones in Arabia. There was a willow like tree in the center of a small park, but probably none of the greenery was originally native to the valley. There were barren sand rock mountains approximately north and south of Damascus walling the city in a valley. We had lunch at Damascus airport, and left without trouble in about 1 hour. We arrived in Istanbul about 3 hours before sunset. The airport is several miles from the city. The sea of Bosporus is surrounded by steep and rather barren hills, but with some apparent scrub tree growth. There was quite a strong northeast wind with white caps on the sea. I saw a couple of dhow like rigs and one small fore and aft sloop with two jibs. Flying over it the water was very clear with a tropical look to it. The air was quite cool almost cold and there was a short spell of rain from large cumulus clouds. There was quite a pretty sunset. The fields around the airport were covered with a rough thin tan grass something like

the fields by the sea in New England. A small bird of green  
brown's lace was abundant, some old white daisies, small milk  
like weeds, yellow daisies, two or three kinds of thistle with  
one kind with a bright blue stem. I saw one maple tree  
with leaves shaped like the sugar maple, but it was different  
and stem doesn't just like *Rhamnus pseudacacia* except  
the bean pods were thinner and less than half as long.

There was one wind mill just like ones on Long Island and  
there were gulls like herring gulls only smaller. To the south  
across the water were two larger dompling like islands the

 gravel or rock was tan in color, and we had a white  
light house on it. They were in the process of  
finding trouble with the airplane, but after some delay, we  
finally got off after sunset, bound for London. We also  
ate at Istanbul. We arrived in London around 4:00 A.M.

The night was clear and we passed over strips of sea  
and I also think the Alps or some mountains which looked  
high and rugged. London was a pretty sight from  
the air with its myriads of yellow, white, and light  
green lights. Our welcome in the London airport consisted  
of watered coffee and hard bread sandwiches and a long  
wait. The starting of a bridge game ended it nicely. We  
left just before dawn.

Aug. 17 - Our next stop was beautiful Shannon Ireland which  
was beautiful and green with lush green fields and rounded  
haystacks, and the beautiful wide Shannon river. We  
got a royal welcome, and a wonderful breakfast, and  
we were sorry to leave.

We had a good trip toander with, however, a head wind  
of 33 m.p.h. and at 10,000 ft 50° F outside, and around

70° F atander. The greenness and the blue lakes ofander  
were beautiful to look at. Even in summer the evergreens  
are far in predominance. We stopped atander  
long enough ~~so~~ that I could send a cable to  
Incile, and cut my chin with a borrowed  
razor. It was the shortest stop.

We reached La Guardia 5 p.m. New York time.  
Then we waited around interminably thru customs,  
but I was lucky, and did not have much delay  
once my bags were looked at. It was swell  
to have Incile and all the family waiting for  
me at the airport, including George and Gladys.

We ~~reached~~ left the airport probably after  
6:30 P.M. and all had dinner at the apartment.

## Similarity of Fish names (Persian Gulf and Red sea)

There are few animals or plants that bear a greater variety of names for each species or kind than do fish. The catfish of the middle west is the bullhead of New York and the horned trout of New England. Even as small an island as Puerto Rico has one name for the thread herring on the west coast and another on the north and east coasts.

There are also a few cases of a fish name being common between languages (sometimes with slight variation in spelling). The half beak, *Hemirhamphus*, is known in Spanish as the "tally-hoo" in Puerto Rico, and is likewise known by the French, English, Dutch, and native creoles of the Lesser Antilles.

In the Persian Gulf there are a few names which are similar between Persia, Bahrain, and Saudi Arabia. For comparison I have used three references: H. Blegrad's "Fishes of the Iranian Gulf"<sup>1</sup>, W. H. Lane's "Game Fishes of the Persian Gulf"<sup>2</sup>, and my own notes taken in Ras Tanura, Bahrain, and Jidda. In all there are 51 names that have an approximate similarity.

From a single look at these names one can say that these fishes are among the best known, most abundant, and most edible fishes or in one or two cases they are fish to be feared because of poison or dangerous spines such as the scorpion fish "farjal" and the sting ray "takhmal".

The large spotted grouper, *Epinephelus tauvina* is known as the "hamar" from Ras Tanura to Jash, and possibly is so named all over the Persian Gulf and the Gulf of Oman. Even the name "balūl" of smaller *E. tauvina* is also common to the 3 references and these different places. The large mullet, *Mugil*,

is called "biash" and is also common to these 3 references. Blegrad's work covered the greatest area and the longest period of time, Lané's work consisted of repeated fishing trips to the area of Jash on Persia's Achran coast which is actually in the Gulf of Oman. My work consisted of 5 months covering Ras Tanura, Bahrain, and Jidda.

Between the Red Sea and the Persian Gulf there is no similarity of names, with the sole exception of the shrimp "sulyan". There is, however, the name "wazāghah" which in Bahrain and Ras Tanura refers to a type of sand lizard that lives on the beach. At Jidda, the same name refers to a kind of sand perch, *Parapercis*.

Some fish names, if not quite a few, are common throughout the Red Sea and the Gulf of Aden. For instance, *Cyprinus carpio*, the king mackerel is known as "dorak" in Jidda and Aden, and also the mullet, *Mugil*, is known as "arabi".

The fisherman's last hope then is that the scientific nomenclature is standardized with one name for each kind of fish. Unfortunately this is not the case, except in a few instances; but it is the ultimate ideal of most biologists at some date in the distant future.

Fishes mostly from Task according to author

Middle East Science a survey of subjects other than Agriculture  
 By E. B. Worthington, a report to the Director General  
 Middle East supply centre August 1945  
 London; His majesty's stationery office 1946  
 Oxford University Press

p.111-121 Chap. X Marine Fisheries (brief account of Red Sea, Caspian, P. Gulf) <sup>East Mediterranean</sup>

p.122-140 Chap. XI Inland Fisheries p.p. 129-138 good account  
 of fish farming in Palestine, mostly carp pond culture  
 1½ meters in depth with mention of a species of Tilapia as  
 an alternative fish. Tilapia galilee 'Musht'. There is also  
 mention of the use of Gambusia for mosquito control in the  
 ponds off the river Jordan. Mention also is made of a species of  
Barbus 'salmon' occurring in the Euphrates River.

P. 130 - "The carps normally breed in the spring and growth is very  
 rapid, so that they attain a market size of 3/4 kg. each about  
 8 months after hatching from the egg." a kilogram is 2½ lbs.

p.119 Gulf of Aqaba - "At Mukhallat successful experiments -- cooking sardines in nets,  
 expressing oil with hand-press, and drying residue for fodder or manure."

Bombay Nat. Hist Soc. Vol. XXV No. Mar. 1917

Game Fishes of the Persian Gulf Part II Major W. H. Lane
